1 THE CLERK: All rise

2 THE COURT: Be seated, please.

3 Good morning.

4 Ready to proceed?

5 MR. BONO: Your Honor, just one
6 housekeeping matter. With respect to
7 yesterday's testimony, I would also ask that the
8 portion of the deposition designation transcript
9 relating to Mr. Kim's testimony relating to the
10 Seico license be sealed as part of the trial
11 transcript.

12 I think yesterday I only mentioned
13 Hitachi and CPT. And I would also like that
14 sealed. Plus, all the exhibits that relate to
15 those agreements in that testimony.

16 THE COURT: Mr. Tyler, any
17 objection?

18 MR. TYLER: No objection, Your
19 Honor.

20 THE COURT: It will be done
21 without objection.

22 MR. TYLER: May I proceed, Your
23 Honor?

24 THE COURT: Yes.

BY MR. TYLER:

Q. Welcome back, Dr. Putnam.

A. Good morning.

Q. So, in your experience, do you believe that this is a complex damages case?

A. Yeah. I would say that of all the damages case I've worked on, this is probably the most complex.

Q. Why do you say that?

A. Well, in a typical case, you have one or maybe a couple of patents asserted by one party against the other. But in this case, you have a relatively large number of patents asserted by two competitors against each other.

Q. Is there anything about the type or amount of data that's different in this case?

A. Well, in this case, we have unusually good data on the cross-licensing behavior of the parties, in situations like I described where you have two parties that have claims against each other.

Q. Okay. The amount of data, does that make -- and type of data does, that make

1 your job harder or easier in this case?

2 A. Well, it makes your job harder
3 initially because cross licenses are inherently
4 complicated than one-way licenses. On the other
5 hand, if you use more sophisticated methods, you
6 extract very precise estimates of the damages
7 that we're trying to get to in this case.

8 Q. Okay. And we can go to the slides
9 now, and I'd like for you, if you could sort of
10 summarize what our complex problem is here.

11 A. Yes. The problem that we're
12 trying to get to at the end of the day is how to
13 value the four patents that AUO has asserted in
14 this case. But these four patents aren't just
15 sitting in space or in a vacuum. They're
16 actually located in a particular context of
17 industry and a pair of firms they're negotiating
18 over.

19 Q. So in solving this problem, what
20 approach did you use?

21 A. Well, I adopted four principles, I
22 think, that guided my investigation.

23 Q. What's the first principle?

24 A. Well, the first principle is you

1 want to - to predict the -- how the parties are
2 going to behave in a hypothetical negotiation
3 with each other. Then the best indicator of how
4 they will behave is how they behaved in the
5 past.

6 So the past conduct of the
7 parties, in particular in their cross-licensing
8 negotiations with other competitors in the
9 industry is going to be your best predictor of
10 how they would behave in a cross-license with
11 each other.

12 So the graphic shows the -- some
13 of the cross-licenses that each of the parties
14 has entered into with other LCD competitors.

15 Q. Okay. What's your other principle
16 here?

17 A. The second principle is that you
18 want to analyze all the data. So what I've done
19 is modified the graph to show that each of the
20 parties brings to the table, not only the past
21 cross-licensing behavior, but also the entire
22 patent portfolio.

23 So you see each party sort of
24 papered over with hundreds or thousands of

1 patents that are part of the entire portfolio.
2 You want to take those patents into account in
3 determining the portion of the total value that
4 is attributable to the four patents that have
5 been asserted.

6 Q. And do you have a third principle?

7 A. Well, in the third principle,
8 again, I've illustrated this in the graphic.
9 The parties have cross claims against one
10 another.

11 So each party is sitting across
12 the table making a claim against the other
13 party. And so you have a symmetric bargaining
14 situation, which is unusual.

15 And what you want to do is develop
16 a method that takes account of that symmetric
17 bargain situation and treats each party
18 evenhandedly without bias. So that the method
19 that you apply in determining the value of one
20 party's asserted patents and exactly the same
21 method, you would apply to the other party in
22 determining the value of their asserted patents.

23 Q. And does this mean you're going to
24 have the same damages number for both sides?

1 A. No, of course not. The method is
2 going to be the same, but since the data for
3 each side are going to be different, you're
4 going to end up with different numbers, because
5 they're asserting different patents and accusing
6 different sales.

7 Q. And what is -- you said the four,
8 what's the fourth principle?

9 A. The first principle is that each
10 one of the four patents is a part of the whole,
11 so what this means in this case is that the
12 parties typically transact over a whole, meaning
13 an entire patent portfolio and what you want to
14 do is look at the contribution to that whole of
15 the four asserted patents that each side has
16 actually brought to trial.

17 It's sort of like with a pizza,
18 you got a whole pizza and you want to figure out
19 the value of the slices of the pizza, so in this
20 case the price of the whole pizza acts as a
21 ceiling on the price of the individual slices.

22 Q. Okay. So in this case, why do you
23 think one should consider all the cross licenses
24 and patent portfolios for solving the damages

1 problem?

2 A. Well, remember the objective of
3 the exercise of what we're trying to do here is
4 to simulate the outcome of a hypothetical
5 negotiation between the parties. The way the
6 parties have actually behaved in the past is
7 that they negotiate licenses with other members
8 of the industry over their entire patent
9 portfolios. So if you want to figure out how
10 they're going to negotiate with each other in a
11 hypothetical negotiation, then based on the
12 first principle you should look at the way
13 they've actually negotiated with each other in
14 their past licensing -- not with each other, but
15 with other similar firms with past licensing
16 conduct.

17 Q. Could you give us an overview of
18 the method you're going to use to solve the
19 problem given these principles?

20 A. Sure.

21 The basic approach is going to be
22 what I have called an industry price method of
23 asserting -- of valuing individual patents. And
24 what this means is that we're going to first of

1 all figure out the average price at which firms
2 transact their entire patent portfolios, and
3 then break that down so that we can figure out
4 the particular price that should be charged for
5 the individual asserted patents.

6 Q. And can you explain the steps of
7 your method?

8 A. Yes. It's basically a three-step
9 process and I think the next slide shows this.
10 The first step is that we want to recognize the
11 data that we observe is a cross license
12 balancing payment. And so in each of the cross
13 licenses that we find in the industry, one of
14 the parties makes a payment to the other party.
15 Now, it's represented on the screen by a green
16 circle. But a green circle is -- green is not a
17 primary color, it's really a mixture of two
18 primary colors, yellow and blue.

19 So what I have shown is in a
20 balancing payment that's really the net of
21 claims that each party has made against the
22 other, so firm A makes a claim against firm B,
23 that's the yellow circle, firm B makes a claim
24 against the firm A, that's the blue circle, and

1 when you mix the circles together you get the
2 balancing payment or the net payment that the
3 weaker party pays to the stronger party.

4 Q. The industry data that you
5 mentioned are -- what data do you have that
6 you're going to look at?

7 A. So for each of the agreements in
8 the industry we have the green circle, which is
9 the amount that in that transaction one party
10 paid to the other, so we have a total of eight
11 cross license transactions and they involve all
12 of the major competitors in the industry. LG
13 has a license with NEC, AUO has a license with
14 Sharp and so forth. And so we're going to take
15 all those -- we're going to use the balancing
16 payments that we observe in these agreements to
17 make a prediction and I think this next slide
18 actually shows that.

19 Q. How are you going to make this
20 prediction?

21 A. Well, the prediction -- just to be
22 clear, the prediction we want to make is the
23 balancing payment in the hypothetical
24 negotiation between AUO and LG. What we're go

1 to do is use a statistical technique called
2 regression analysis which is going to summarize
3 all of the data and determine the rate at which
4 given the particular characteristics of these
5 parties they would exchange their -- the terms
6 on which they would exchange their portfolios
7 and what the size of their balancing payment
8 would be.

9 Q. Is there another way you could
10 have done this instead of using the regression?

11 A. I could have taken one of the
12 cross license agreements at random and sort of
13 eyeballed it and said well, I think this
14 particular agreement is the most comparable and
15 so that's why I think it should be imputed to
16 the parties in a hypothetical negotiation, but
17 that -- I was going to say that that's -- you
18 know, as an economist what I'm trying to do is
19 to summarize all the data and determine, you
20 know, sort of the behavior of the parties in all
21 of their agreements and not favor one agreement
22 over the other.

23 Q. So what are you going to do with
24 this prediction?

1 A. Well, that's the first step of the
2 process. So I think the next slide shows that
3 we're going to assume that we have got that
4 prediction for the balancing payment that would
5 exist between the parties so we have the green
6 circle for AUO and LG.

7 Q. This would be a hypothetical
8 negotiation over hundreds or thousands of
9 patents?

10 A. Yes, exactly. That's the exchange
11 of the entire worldwide rights to both parties'
12 patent portfolios.

13 Q. Okay.

14 A. And then what we want to do is
15 decompose that, we want to sort of extract from
16 that process. We know that the green circle is
17 really the combination of a yellow circle and a
18 blue circle, the yellow circle being AUO's claim
19 against LG, the blue being LG's claim against
20 AUO.

21 And for the purposes of this part
22 of the trial we want to focus on the yellow
23 circle, which is AUO's claim against LG.

24 Q. This is the second step?

1 A. Yes. And again, the regression
2 analysis, because of the way I have formulated
3 the model, the regression analysis is actually
4 going to allow you decompress the predicted
5 balancing payment into the two constituent
6 parts.

7 Q. What's your third step?

8 A. The third step now that we have
9 AUO's aggregate claim against LG for the
10 hundreds or thousands of patents that it's
11 asserting, what we want to do is narrow that
12 down to the contribution of that, to that claim
13 of the four patents that it's actually asserted
14 in this trial. And we're going to use a method
15 that I call count, rank and divide to try to
16 figure out how to distribute that pie so that
17 each patent gets its appropriate share.

18 Q. I'm going to jump right in and see
19 how you use this method to solve the problem
20 here. Where do you begin, what's the first
21 step?

22 A. Well, the parties have already
23 agreed that this is not a lost profits case, so
24 we start with using a reasonable royalty.

1 Q. And how do you calculate a
2 reasonable royalty?

3 A. A reasonable royalty is what
4 emerges from a negotiation between a willing
5 licensor and a willing licensee.

6 Q. And what do you mean by that,
7 willing licensor, willing licensee?

8 A. A willing licensor is somebody who
9 knows that they have to license their patent,
10 and a willing licensee is somebody who knows
11 that the patent is valid and infringed and
12 recognizes that they have to buy the rights to
13 the patent, and so then the only question is
14 what's the price at which the rights to the
15 patent or patents in this case are exchanged.

16 Q. And should that allow the willing
17 licensor and willing licensee to make a profit
18 in your understanding?

19 A. Yes, each side should be able to
20 make a profit as a result of that exchange.

21 Q. Does the law, based on your
22 understanding, provide a framework for how you
23 would construct, find what the willing licensee
24 and willing licensor would pay?

1 A. Yes. The standard framework
2 that's used for reasonable royalty is called the
3 Georgia-Pacific factors.

4 Q. Did you consider those in this
5 case?

6 A. Yes, I did.

7 Q. Let's walk through how you did
8 your analysis on the Georgia-Pacific factors.
9 If we go to the next slide.

10 A. Sure.

11 Q. Can you explain what this shows?

12 A. Yes. Well, there are fifteen
13 Georgia-Pacific factors. And the way they're
14 listed in this case is actually in kind of a
15 semi-random order, so I find it convenient to
16 regroup the factors so that you consider similar
17 factors all at the same time with related data.
18 So I have listed them here.

19 The first is the actual licensing
20 conduct of the parties. Secondly, information
21 on the profits. Third, the commercial
22 advantages of the technology. And finally, the
23 parties' commercial relationship and their
24 bargaining position.

1 Q. Do all fifteen of the
2 Georgia-Pacific factors fall within your four
3 groupings?

4 A. Yes, that's right.

5 Q. Do you view in this case any one
6 of these groupings as more important than the
7 others?

8 A. In this case given the data and
9 the conduct of the parties, I would say that the
10 first group is the most important. Again, what
11 we're trying to do is simulate the outcome of a
12 hypothetical negotiation. And what we have good
13 information on is how each of these parties has
14 negotiated with other competitors in the past.

15 So in the first factor, for
16 example, which is the rates, or the first two
17 factors, the rates paid and received by the
18 parties, the court, or the law looks in
19 particularly to whether there is an established
20 royalty and when looking at an established
21 royalty it determines something for consistency
22 of behavior. Here we're looking again for
23 consistency of behavior.

24 Q. When you said established royalty,

1 do you believe that there is an established
2 royalty in this case?

3 A. No, because an established royalty
4 typically refers to the rate that is charged for
5 a particular patent. The parties don't license
6 any of the asserted patents on an individual
7 basis so there is no license you can point to
8 which says here is the price of the individual
9 patent. But what the law does look for is
10 consistency, as I said. And so what you're
11 looking for is consistency of behavior. And in
12 this case, they consistently license their
13 portfolios at a very predictable rate

14 Q. Why do you care about consistency
15 of behavior from the past licensing?

16 A. Well, if you go back to our first
17 principle, the best way to figure out what the
18 party will do in a hypothetical situation is to
19 look at what they have done in similar past
20 situations. And so, if you can -- if you are --
21 if you can understand -- if their past behavior
22 is consistent, then you are more likely to be
23 able to predict what they've done, what they
24 will do in the hypothetical situation.

1 Q. Okay. So the consistency of
2 behavior will set the stage for the hypothetical
3 negotiation?

4 A. Yes, that's exactly right.

5 Q. What evidence did you consider in
6 this case regarding the parties' past licensing
7 conduct?

8 A. Well, we looked at -- there's a
9 very large number of licenses that were
10 produced. I and my team went to look at more
11 than 70 industry licenses, both within the
12 industry between the LCD competitors and also
13 between an LCD competitor, and somebody outside
14 the industry.

15 And we focused, in particular, on
16 the eight cross-licenses that are observed
17 between competitors, because that's the closest
18 analog to the hypothetical negotiation that we
19 have.

20 Q. Okay. And did your review of
21 licenses include the AUO licenses that Ms. Chen
22 testified about on the first day of trial?

23 A. Yes.

24 Q. Did you prepare summaries in this

1 case for your review of licenses?

2 A. Yes.

3 Q. Okay. Can we go to AUO 267,
4 please.

5 And what is -- is this one of your
6 summaries?

7 A. That's right.

8 Q. What does this summary show?

9 A. This summary shows -- and again,
10 the first column has been redacted, because
11 that's got the names of the licensor, or I
12 should say the other party to the agreement.
13 These are AUO across licenses.

14 And so we've redacted the names of
15 the other party. But as you go down the list,
16 you see who is -- who the parties are to the
17 cross-license, the date of the license, the --
18 perhaps most importantly the payments that were
19 made in the license.

20 And then on the right-hand side,
21 you have a description of the patents that were
22 transacted. And there are typically portfolios
23 on each side.

24 Q. Okay. And did you rely on the

1 summary in forming your opinions in the case?

2 A. Yes.

3 MR. TYLER: Your Honor, we'd move
4 for admission of AUO 267 at this time. And,
5 again, as I mentioned yesterday what will be
6 submitted in the record is unredacted.

7 MR. CHRISTENSON: We'll preserve
8 our objection, Your Honor.

9 BY MR. TYLER:

10 Q. And did you do a similar summary
11 for LGD'S licenses?

12 A. Yes, I did.

13 Q. Can we turn to AUO 268, please?
14 Will you tell us what this is?

15 A. Well, this is the analogous
16 summary for LGD. So it's got exactly the same
17 information, but with LGD's licensing partners
18 instead.

19 Q. Okay. And did you rely on this in
20 forming your opinions in the case?

21 A. Yes, I did.

22 MR. TYLER: At this time, we'd
23 move for admission of AUO 268, Your Honor.

24 MR. CHRISTENSON: Your Honor,

1 we'll preserve our objection. If I may, I'd
2 just like to have a standing reservation of
3 objections regarding each of the exhibits
4 offered into evidence from Dr. Putnam's report.

5 THE COURT: When you say you want
6 to maintain or continue your objection, towards
7 the redaction?

8 MR. CHRISTENSON: No, Your Honor.
9 It's an objection. As I understand, Mr. Tyler
10 is offering it into evidence, each of the
11 exhibits that Dr. Putnam has from his report.
12 There are going to be, I think, several
13 exhibits.

14 And rather than continuing to
15 interrupt and object to each one individually, I
16 would just like to preserve our objections
17 regarding each of the exhibits offered in today.

18 THE COURT: Because it's -- this
19 ultimately goes toward your initial objection of
20 methodology?

21 MR. CHRISTENSON: Yes, Your Honor.
22 That's correct.

23 THE COURT: Just so the record is
24 clear, it's not redaction. I think you're both

1 kind of in some compromising position.

2 So I'll -- so I'll admit it
3 subject to that methodology objection.

4 MR. TYLER: Okay. Thank you, Your
5 Honor.

6 BY MR. TYLER:

7 Q. So let me now turn your attention
8 to AUO 269. And did you also summarize AUO and
9 LGD's in licenses in this case?

10 A. Yes. As I mentioned, it's
11 important to analyze all the data.

12 So in addition to the
13 cross-licenses, we also looked at each parties
14 one-way licenses. A one-way license is when the
15 firm is either licensing in technology of
16 another firm or licensing out its own
17 technology.

18 And so Exhibit 269 shows the same
19 information for AUO for all of its in licenses.
20 And again, the party from whom it's licensing
21 technology has been redacted.

22 But we have the title and
23 financial terms of the agreement summarized
24 here.

1 Q. And did you rely on this in
2 forming your opinions?

3 A. Yes.

4 MR. TYLER: I'd move for admission
5 of AUO 269.

6 THE COURT: It's admitted.

7 BY MR. TYLER:

8 Q. Let's go to AUO 270, please. And
9 is this the same thing for LGD?

10 A. Yes. It is symmetric for LGD,
11 exactly the same information with the partners
12 redacted.

13 Q. And this is their in and out
14 licenses?

15 A. In and out licenses, relative,
16 that's right.

17 Q. So not cross licenses?

18 A. No the -- not cross licenses, only
19 one-way licenses.

20 Q. And did you rely on this summary
21 in forming your opinions as well?

22 A. Yes, I did.

23 MR. TYLER: We'd move for the
24 admission of AUO 270.

1 Your Honor, we move for admission
2 of AUO 270.

3 THE COURT: It's admitted.

4 MR. TYLER: I am sorry. I didn't
5 hear you.

6 BY MR. TYLER:

7 Q. And I'd like to now put up the
8 license summary. This is a demonstrative.

9 And, Dr. Putnam, did you prepare a
10 summary of LGD's licenses in this case? And
11 this is the cross licenses and all the licenses
12 we've seen so far, but with their trial exhibit
13 numbers on them.

14 A. Yes. There's three categories of
15 agreements here.

16 There's the LG cross-licenses.
17 There are one-way licenses, and also their
18 purchasing agreements of various patents and
19 patent portfolios.

20 MR. TYLER: Okay. And, Your
21 Honor, we had premarked this. It's a summary
22 for his testimony as AUO 1563.

23 And we would move for admission of
24 the summary as well as underlying exhibits based

1 on their trial exhibit numbers.

2 THE COURT: All right. It's
3 admitted.

4 BY MR. TYLER:

5 Q. All right. Dr. Putnam, those were
6 quite a lot of licenses. And you mentioned
7 earlier you're looking for consistency of
8 behavior.

9 Did you find it?

10 A. Yes, I did.

11 Q. What consistency did you find
12 among the licenses?

13 A. Well, the basic pattern that you
14 observe in all these licenses is the parties
15 negotiate a worldwide portfolio license with a
16 lump sum balancing payment from the weaker party
17 to the stronger party for a fixed number of
18 years, or sometimes the life of the patents.
19 Typically five years or, as I said, the life of
20 the patents.

21 Q. And the cross-licenses you
22 observed that within the competitors -- or there
23 are a lot of one-way licenses up there, too;
24 right?

1 A. Yes, that's right.

2 Q. So the cross-licenses, you
3 observed in which category?

4 A. Well, the cross-licenses are much
5 more commonly found between competitors in the
6 LCD industry. And we actually tested for that
7 to determine statistically whether it's more
8 likely that a firm cross licenses within the
9 industry.

10 And the answer is that
11 statistically speaking, it is much more likely
12 that you would cross-license.

13 Q. And did you prepare a summary
14 where we can see that?

15 A. Yes.

16 Q. Let's go to AUO 266, please.

17 A. Yeah.

18 Q. Can you tell us what this is?

19 A. I got ahead of myself. What we've
20 got here is the -- either -- these are a summary
21 of licenses within the LCD industry. And,
22 again, we've redacted the names of the other
23 competitors.

24 What I've shown here is the firms'

1 market share and their current size of their
2 current patent portfolio. And then the table is
3 divided into LCD manufacturers and then licenses
4 with other firms.

5 And so the bottom line of all this
6 is that of the -- among the LCD manufacturers,
7 19 of the 24 licenses that you observe are
8 cross-licenses. Whereas when firms are
9 licensing out of the industry, only 16 out of
10 the 49 licenses are cross-licenses.

11 And so a statistical test tells us
12 that it's much more likely that within the
13 industry, a firm is going to cross-license.

14

15

16

17

18

19

20 Q. Did you rely on this summary in
21 forming your opinions?

22 A. I did.

23 MR. TYLER: And at this time, we
24 would ask for move to admit 266 in evidence.

1 THE COURT: It's admitted.

2 BY MR. TYLER:

3 Q. So what, if anything, does a
4 consistency that you found in the licensing data
5 tell you about the hypothetical negotiation
6 between AUO and LGD?

7 A. Well, again, this provides a
8 framework for the hypothetical behavior in
9 negotiation. Under the first principle, if you
10 know what the parties have done in the past,
11 then you are better able to predict what they
12 would do in a hypothetical negotiation. In the
13 agreements that we are looking at, seven of the
14 eight agreements are agreements that involve
15 either AUO or LGD.

16 So we can be pretty confident that
17 if those agreements are consistent, then the
18 parties would behave with one another
19 consistently with their past behavior.

20 Q. And besides licenses, did you have
21 any other evidence or proof that would show us
22 that LGD and AUO would act in this way?

23 A. Well, of course, I also looked at
24 testimony of the corporate representatives on

1 licensing and what they had to say about their
2 licensing policies.

3 Q. And did you prepare a summary of
4 some of that testimony?

5 A. Yes, I did.

6 Q. Can we turn to AUO 273, please.

7 It's a lot of information here,
8 but can you tell us what's in this exhibit?

9 A. Yeah. It's a little hard to read,
10 but what I did was examine the testimony of each
11 of the corporate representatives in various
12 dimensions to characterize how they viewed
13 licensing according to whether they would, you
14 know, do a one-way license or a cross-license,
15 the type of payment that they would exchange
16 between themselves and their competitors and so
17 forth.

18 And then I gave sample quotations
19 from their deposition testimony.

20 Q. The second to -- I guess second
21 from the right column is for Joo Sup Kim. Who
22 is that?

23 A. Mr. Kim is LGD's vice president
24 and corporate representative designated to

1 testify about licensing matters.

2 Q. And Ms. Chen on the right
3 column, she's the one who testified for AUO?

4 A. Yes. We heard from her on the
5 first day of the trial.

6 Q. You prepared this summary?

7 A. Yes, I did.

8 Q. And did you rely on it in forming
9 your opinions?

10 A. I did.

11 MR. TYLER: I move to admit AUO
12 273, Your Honor.

13 THE COURT: It's admitted.

14 BY MR. TYLER:

15 Q. And what did these representatives
16 say about balancing payments?

17

18

19

20

21
22
23
24

Q. Okay. Now, did you cross -- I mean, did you chart the cross-licensing balancing payments that you observed in this case?

A. Yes, I did.

Q. Can we go to the next slide?

And what does this slide show?

A. Well, here we have -- now we're getting down to the actual data. These are the eight licenses that I mentioned, these are the balancing payments that are observed in those licenses the parties actually agreed to pay expressed in US dollars, and the present value of US dollars at the time that the license was executed.

Q. Okay. So does each of these represent a separate cross license in the industry?

1
2

16
17
18
19
20
21
22
23
24

Q. So it looks like there is a fair amount of variation here. How are you going to use this to predict what might happen between AUO and LGD?

A. Well, remember the first step of the process, it's a three-step process and the first step is to simply predict the balancing payment that would emerge from a cross license between LGD and AUO. So what you want to do is take the characteristics of each of the parties and then try to predict the balancing payment.

Q. Could you do that through analyzing whether one of these was comparable?

A. Well, again, one method of doing this would be to take an agreement and sort of eyeball it and say this is the agreement that I think is most comparable, so I'm going to assign that agreement to the parties.

But as an economist what I am

1 trained to do is to say let's use all the data,
2 let's take as inputs the characteristics of the
3 parties that they brought to these negotiations
4 and let's see if we can use these
5 characteristics to predict how they actually
6 behaved in the negotiation and what would
7 emerge, what would emerge from it as a final
8 balancing payment.

9 Q. Do you have any tools to help you
10 with that?

11 A. Yes. Well, that's where the
12 regression analysis comes in. A regression is
13 simply a way of taking a mathematical equation
14 and fitting it so that it produces the most
15 precise prediction of the behavior that you
16 actually observe. What you do is -- what you
17 want to do in this case is take as inputs the
18 characteristics of the parties and then as an
19 output, you want to predict how they behaved or
20 their -- the net of how they behaved, which is
21 their balancing payment.

22 Q. How in the world would you know
23 what inputs to use, there is a lot of
24 characteristics to these companies?

1 A. Sure. But I think Georgia-Pacific
2 organizes the data for us. So what we're going
3 to be concerned with primarily is what the
4 strengths of the parties bargaining positions as
5 they come to the table and that's reflected, for
6 example, in the fourth group of Georgia-Pacific
7 factors that I identified earlier, the parties
8 commercial relationship, and the size of their
9 patent portfolio.

10 Q. In your work, did you prepare a
11 summary of the raw data that you used as inputs
12 to construct a regression?

13 A. Yes, I did.

14 Q. Can we go to AUO 274.

15 What does this show us?

16 A. This is actually quite a useful
17 slide. Again, we have on the left hand --

18 Q. Take that down please. There was
19 one column that was not redacted. It listed the
20 individual paying parties, so if you don't mind,
21 go ahead and tell us what that exhibit showed in
22 the abstract. We'll just go ahead and put it in
23 the record, go ahead and explain what it showed?

24 A. Sure. Okay. All right. So as I

1 said, the problem conceptually is to take the
2 parties' characteristics and to predict what
3 they would do in the negotiation. And so what
4 this table summarized is for each one of the
5 licenses, the parties' patent portfolio, the
6 size of the patent portfolio at the time of the
7 license which reflects their bargaining power
8 and the sales of the exposed sales of the other
9 party that their patent portfolio is being aimed
10 at.

11 So if you think of this as being
12 to use one metaphor as being arrows in a quiver,
13 so two parties are negotiating with each other,
14 what's going to emerge from the negotiation is
15 is determined by the number of arrows in my
16 quiver, which is the size of my patent
17 portfolio, and the size of the target that the
18 other party represents, which is the exposure of
19 its sales. The more it sells, the bigger the
20 target is.

21 So I guess we resolved our
22 technical difficulties.

23 So, but...

24 Q. What does this -- so the second to

1 right-hand column, are those the actual payments
2 that were made that we charted?

3 A. Yes, that's the output. So the
4 middle two columns are the number of patents and
5 the sales, that's the inputs. And then the next
6 to the last column is the output, which is what
7 the weaker party actually paid to the stronger
8 party. That's a real number in this
9 negotiation.

10 Q. Okay. And on the far column, what
11 is that, effective royalty?

12 A. That's the effective royalty rate.
13 So in these agreements, what's actually
14 happening is that one party is writing a check
15 to the other party for a fixed amount of money.
16 If you want to compare that to a running royalty
17 rate, the way that you would do that is to
18 divide that number by the expected sales so you
19 would get a rate for dollar of sales, that's
20 what an effective royalty rate is.

21 Q. Did you notice anything about the
22 range of rates here?

23
24

23
24

Q. Just to be clear, we're talking about --

THE COURT: Do you have an unredacted hard copy of this?

MR. TYLER: Yes, we do. And it's in the binder as Exhibit 274, if you have the big binder. This is actually -- these are actually exhibits.

THE COURT: Right. But I'm -- could you show the clerk where it is and she can pull it out for me.

MR. TYLER: May I approach, Your Honor, and hand these up?

THE COURT: Sure.

(Discussion off the record.)

MR. TYLER: May I proceed, Your

1 Honor?

2 THE COURT: Yes.

3 BY MR. TYLER:

4 Q. So this is the real data, right,
5 because we're talking about constructing a model
6 but these are the payments that were actually
7 made?

8 A. Yes. Before you constructed the
9 model or done any analysis or anything like
10 that, this is what you're actually looking at in
11 terms of what happened and what you're trying to
12 explain.

13 Q. And these are for entire patent
14 portfolios of hundreds of patents; is that
15 correct?

16 A. Yes.

17 Q. And did this -- did this range of
18 rates have any, any relevance to your problem of
19 determining what a royalty would be on an
20 individual patent?

21 A. Well, yes it does. Remember under
22 the fourth principle, the fourth principle is
23 that the asserted patents in this case are parts
24 of a whole, and so in the same way that -- just

1 the way a slice of a pizza is part of an entire
2 pizza.

3 So in effect what you have on the
4 right-hand side is the price of the entire pizza
5 expressed as an effective royalty rate, so the
6 rates that you would charge for individual
7 patents are necessarily capped by those rates,
8 so there is a ceiling for the price you would
9 pay for an individual patent or an individual
10 slice of pizza.

11 Q. And did you prepare this summary?

12 A. Yes, I did.

13 Q. And did you rely on it in forming
14 your opinions?

15 A. Yes, I did.

16 MR. TYLER: Your Honor, at this
17 time we move for admission of AUO 274.

18 THE COURT: It's admitted.

19 BY MR. TYLER:

20 Q. So you have these inputs of
21 strength and exposed sales, and this is all
22 their sales; correct, exposed sales?

23 A. Worldwide sales, yes, that's
24 right.

1 Q. Did you have any other inputs
2 besides these two?

3 A. Well, what we wanted, our first
4 objective is to explain what happens on average
5 when the parties transact their portfolios. But
6 we're particularly concerned in this case that
7 we're insuring that we predict the behavior of
8 the two parties, you know, the two claimants in
9 this litigation accurately.

10 So you can imagine that in each
11 one of these negotiations, parties might behave
12 systematically different from each other. So,
13 for example, one party might have a
14 systematically stronger patent portfolio and
15 that would cause it to pay less in a negotiation
16 or to receive more. Or another party might be
17 an especially good bargainer so that would cause
18 it to pay less in a negotiation.

19 So we're looking for systematic
20 factors that follow the parties around from
21 negotiation to negotiation. And an economist
22 calls those fixed effects.

23 So what I have done as part of the
24 model is to estimate a fixed effect, one for LG

1 and one for AUO, so as part of predicting how
2 they actually behave in these negotiation.

3 Also, I assume that there is this
4 constant that follows the party from negotiation
5 to negotiation and you actually estimate the
6 value that you attach to each party in
7 predicting its balancing payment.

8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24

Q. So I thought you were here on

1 behalf of AUO?

2 A. Well, I am, but the data say what
3 they do, and you have to just go with what they
4 say. And that's the implication of the fixed
5 effects for the two parties.

6 Q. So we talked about your inputs,
7 and I want to move now to see what happens when
8 you push the button on your regression analysis?

9 A. Sure.

10 Q. If we go to the next slide. What
11 does this new line show?

12 A. So what I have done here is just
13 overlay on to the actual data the results of the
14 model. And the green line shows how the model
15 predicts the balancing payment that would emerge
16 in each one of these negotiations based on the
17 characteristics of the party that it brings to
18 the negotiation, including for each of the
19 parties here, the fixed effect that they write
20 to that negotiation.

21 Q. Do you have a summary of your
22 inputs and outputs that made this chart?

23 A. Yes.

24 Q. Can we go to AUO 277, please. We

1 have redactions there.

2 So what is this summary?

3 A. Well, this is the actual data that
4 the input data set and at the end of the day in
5 the far right-hand column, the output which is
6 the payment that's predicted. So you can
7 contrast the predicted payment in the far
8 right-hand column with the actual payment that
9 we observed in the data which is the fourth
10 column from the right.

11 Q. And so the farthest column is the
12 predicted payment?

13 A. Yes, that's right.

14 Q. And does this chart, did you
15 prepare this chart?

16 A. I did.

17 Q. And did you rely on it in forming
18 your opinions?

19 A. I did.

20 MR. TYLER: I move for admission
21 of AUO 277, Your Honor.

22 THE COURT: It's admitted.

23 BY MR. TYLER:

24 Q. So your inputs to your model were

1 the patent portfolio strength, exposed sales,
2 fixed effects. Do those relate to any
3 Georgia-Pacific factors?

4 A. Yes. Well, as I mentioned, in the
5 fourth group of factors you got the commercial
6 relationship between the parties which is --

7 Q. Can we go to slide 21.

8 A. They're obviously competitors, and
9 remember under the third principle that we want
10 to treat them symmetrically because they operate
11 relatively similar positions in the industry.
12 And then under Factor 15 you're looking at the
13 outcome of a hypothetical negotiation which is
14 determined in part by the bargaining strength of
15 the party or the bargaining power it has and
16 that is determined by the size of portfolio it
17 brings to the negotiation.

18 Q. Did you do any tests to verify the
19 accuracy of your model?

20 A. I did.

21 Q. What did you do?

22 A. Well, the standard -- in a
23 regression context, the standard measure of
24 accuracy is something called goodness of fit.

1 And the statistic for that is something called
2 adjusted R squared, what statisticians call
3 this, and an adjusted R squared is a number that
4 represents on a scale of zero to one or from
5 zero percent to a hundred percent the amount of
6 variation in the variable that you're trying to
7 explain that you actually are able to explain
8 using the model, so the most you can explain is
9 a hundred percent, the least you can explain is
10 nothing.

11 In this case the adjusted R
12 squared for my model is .92, or about 92
13 percent, which means that I explain all but
14 about eight percent of the variation that we
15 observe in industry balancing payments.

16 Q. And did you prepare a summary of
17 this analysis, your regression?

18 A. Yes.

19 Q. Can we go to AUO 276, please.

20 And what does this provide us?

21 A. This is just basically a copy of
22 the computer output. It gives the coefficients
23 that are estimated under the regression which
24 gives the industry average royalty rate, the

1 fixed effects for the parties and then as you
2 can see the second to the last line it says
3 adjusted R squared of .916, or about 92 percent.

4 Q. Did you rely on this in forming
5 your opinions?

6 A. Yes, I did.

7 MR. TYLER: Move for admission of
8 AUO 276.

9 THE COURT: It's admitted.

10 BY MR. TYLER:

11 Q. Dr. Putnam, you got R squared up
12 here and talk about regression. How can someone
13 without a Ph.D. in economics know that your
14 model is reliable?

15 A. Well, in addition to the fact that
16 it actually predicts the real world data
17 relatively accurately, I think if you sort of
18 think about the intuition of this, going back to
19 the arrow metaphor, you got a certain number of
20 arrows in your quiver that each side is aiming
21 at the other across the table, and each side
22 represents a target to the other side based on
23 the size of its sales.

24 And so roughly speaking, the

1 bargaining power that each party brings to the
2 table is a function of how many arrows it's got
3 and how big a target the other side is to it.
4 And the more arrows you got and the bigger the
5 other side's target, the better you're going to
6 do in that negotiation and either the less you
7 will pay or the more the other side will pay to
8 you.

9 Q. So how are we going to use your
10 model in this case?

11 A. Well, the first thing, the first
12 of our three steps is to actually predict a
13 balancing payment between AUO and LG when they
14 sit down with each other based on their
15 characteristics.

16 Q. And did you do that in this case?

17 A. Yes, I think there is a slide.
18
19
20
21
22
23
24

1

14
15
16
17
18
19
20
21
22
23
24

Q. Okay. So did you do this for multiple time periods?

A. Yes. Obviously the parties' characteristics are changing in the sense that their patent portfolios are growing over time and the exposed sales of the other party are growing over time. This is taken from 2004.

Q. Why did you do that in 2004?

A. Because two of AUO's patents, the '629 and the '160 patents, the infringement of those patents began according to AUO in 2004.

Q. And for the other two patents in the case, the '506 and the '157, when did you do the analysis for those patents?

A. 2006.

Q. Did you prepare a summary of the different time periods of your analysis?

A. Yes, I did.

1 Q. Can we go to Exhibit 275, please.

2 And 275 shows what?

3 A. Well, here we have overzealous
4 redactions because we have actually redacted the
5 parties to this case.

6 Q. Okay. Sorry.

7 A. So the point of this exhibit is
8 that it shows for each of five hypothetical
9 negotiation dates, all between AUO and LGD, the
10 balancing payment that in this case AUO would
11 pay to LGD as of that date as well as the
12 individual claims that each party would make
13 against each other, which results in that
14 balancing payment.

15 Q. And you have done effective
16 royalty rates for those on the right-hand side?

17 A. Yes, I have.

18 Q. And did you rely on this
19 information in forming your opinions?

20 A. That's right.

21 MR. TYLER: Move for admission of
22 AUO 275, Your Honor.

23 THE COURT: It's admitted.

24 BY MR. TYLER:

1 Q. Let's go back to your example of
2 2004. If we go back to slide 22. So looking at
3 this slide, what does this tell you about AUO's
4 claim for the offensive part of this case?

5 A. So we have accomplished step one,
6 which is predicting the balancing payment. Now
7 we have to take that green circle, which is the
8 mixture of two primary colors, the yellow and
9 blue, and break that down into AUO's claim
10 against LG and LG's claim against AUO. And so
11 that's shown in the next slide.

12 Q. Okay.

13

14

15

16

17

18

19

19
20
21
22
23
24

Q. This is the 2004 time frame?

A. That is right.

Q. So you have this at other time frames as well?

A. The previous exhibit shows the calculations for all the time periods.

Q. Now, you darked out the right side. That's LGD's side of the equation?

A. Yes.

Q. And we will be talking about that in a couple of weeks?

A. That's the next trial. That's right.

Q. Okay. So this isn't your measure

1 of damages.

2 So what else do we have to do?

3 A. Well, now we have finished our
4 second step, which is figuring out the portion
5 of the balancing payment that represents AUO's
6 claim against LGD.

7

8

9

10

11 Q. Okay. Well, before I go to that
12 last step, I want to ask you a question to talk
13 about the portfolio strength.

14 You mentioned that a few times.
15 And you said you looked at the patent portfolios
16 of the parties --

17 A. Yes, I did.

18 Q. -- as well as other parties in the
19 industry?

20 A. That's right.

21 Q. Did you summarize that?

22 A. I did.

23 Q. Can we go to AUO 278?

24 This one's free of redaction.

1 It's publicly available information?

2 A. Yes.

3 Q. So how did you -- well, what is
4 this first, let me ask you that?

5 A. This exhibit just shows for the
6 time period 2000 to 2008 for all the major LCD
7 competitors, the sizes of their portfolio as
8 they accumulate patents over time.

9 Q. And did you compile these lists?

10 A. Yes, I did.

11 Q. How did you do that?

12 A. I used a publicly available
13 commercial database called Delphion.com, which
14 allows you to extract information for each one
15 of these assignees.

16 Q. Okay. And were you here in Court
17 the first day when Dr. Luo from AUO testified
18 about AUO's patent portfolio growth?

19 A. I was, yes.

20 Q. And did his chart match your
21 chart?

22 A. No.

23 Q. Why not?

24 A. Well, remember as part of his

1 testimony, he talked about, or that first day of
2 his testimony, we discussed that AUO had
3 purchased a number of patents from IBM. It
4 turns out AUO has purchased or acquired other
5 firms and patents other over time. Dr. Luo's
6 chart shows, AUO, the size of AUO's patent
7 portfolio as of the date they acquired the
8 various patents.

9 My chart shows AUO's patent
10 portfolio as though it had been receiving the
11 patents that it purchased at the time that they
12 issued. So for example, the 2001, we have the
13 IBM patents that AUO purchased in 2005, but
14 they're assigned to AUO in 2001.

15 Q. And you did the same thing for LG,
16 didn't you?

17 A. Yes, of course.

18 Q. At this time -- did you rely on
19 this chart in forming your opinions?

20 A. Yes.

21 MR. TYLER: Your Honor, we'd move
22 to admit AUO 278.

23 THE COURT: It's admitted.

24 BY MR. TYLER:

1 Q. Okay. So let's go from the
2 results of your model down to your damages
3 conclusion. And let's go to the next slide.

4 This is the last step of your
5 analysis; is that correct?

6 A. Yes, that's right.

7 Q. Would you explain what we're doing
8 here?

9
10
11
12 Now, we have to restrict that
13 claim to the portion of it that's attributable
14 to accused sales in the United States. And then
15 of the accused sales in the U.S., we have to
16 further restrict it to the portion that is
17 attributable to the four asserted patents.

18 Q. Okay. And how do you -- how do
19 you do that here?

20 A. Well, you basically just have to
21 multiply by two adjustment factors. The first
22 of them is taking AUO -- taking LG's sales and
23 varying out the fraction of LG's worldwide sales
24 that are actually made in the United States.

1 And then the second step is to --
2 of those, the set of LG sales in the United
3 States, further take out those sales that AUO
4 has not accused under the four patents.

5 Q. In this case?

6 A. In this case, that's right.

7 Q. All right. So how did you do the
8 -- first, how did you find out the first
9 percentage, the sales in the United States?

10 A. Well, it's important to remember
11 that AUO typically does not track the place that
12 its LCD modules end up. An LCD module is an
13 input into another good, like a computer monitor
14 or a television set.

15 So when AUO says its sells an LCD
16 module to Sony, Sony might assemble that module
17 into a television set in, let's say, Mainland
18 China, and then ship it to the U.S. But AUO
19 doesn't track where that television set ends up.

20 It only knows that it shipped it
21 from China. So you have to -- so it's a
22 two-part process for the module to end up in the
23 U.S., and AUO doesn't track that.

24 So in order to do that, you've got

1 to go to an industry standard source, which I
2 think we mentioned previously, Display Search.
3 And Display Search tracks the two parts of this
4 transaction, not the individual module, but it
5 tracks the sales that AUO makes to China and/or
6 to a customer actually which may be in China.
7 And then it tracks the customer sales into the
8 United States.

9 And so by looking at the fraction
10 of sales that go to the customer and the
11 fraction of the customer sales that go to the
12 U.S., you can infer the fraction that -- of AUO
13 modules, or in this case, LGD modules that end
14 up in the United States.

15 Q. And did you do that in this case?

16 A. I did, yes.

17

18

19

20

21

22

23 Q. Will that number be at the same

24 time for all manufacturers?

1 A. No, it's not. It's not the same,
2 because it depends on where the customers of
3 each one of the parties in this case sell their
4 products. And that, obviously, varies depending
5 on how they market their products.

6 Q. And then the second percentage is
7 the percentage of accused products?

8 A. Yes. So then we have to take
9 that, the sales that end up in the U.S. and
10 figure out what fraction of them are actually
11 accused under one of the four patents.

12

13

14

15

16

17

18 Q. So it looks like the last step in
19 your flow chart is to determine the value share
20 of the asserted patents. How do you do that?

21 A. Okay. So we're getting close.

22

23

24

1 And now we've got to apportion it
2 among the four asserted patents. And to do
3 that, we use this method that I mentioned called
4 count, rank and divide.

5 Q. Okay. Explain that to us.

6 A. Sure. It's sort of like you could
7 think of this as being very similar to the
8 problem that you face when you invite people
9 over for Thanksgiving dinner. You've got a
10 certain number of guests.

11 You've got to figure out how to
12 apportion the food among those guests. And
13 you've got to divide those portions so that each
14 guest's portion adds up to the entire amount of
15 food that you've got.

16 So the difference here is --
17 there's a couple of differences. One of them is
18 that instead of having a dinner party for eight,
19 in this case, you've got thousands of patents in
20 the portfolio. And so you've got to find a way
21 of giving them their correct portion.

22 And you don't necessarily -- you
23 aren't able to look at a single number, which
24 tells you -- I should say you've got to find a

1 way of assigning a single number to each one of
2 these patents, so that it gets its correct
3 portion.

4 Q. Okay. I think the counting is
5 easy. We've already seen that.

6 How do you -- you've got to rank
7 thousands of patents from top to bottom?

8 A. Yes. So, in the same way that you
9 had thousands of dinner guests, what you might
10 do is look for an indicator that would predict
11 their appetite.

12 So you might say that the amount
13 that the guest weighs is correlated with how
14 much they eat. So here you've got to find a
15 ranking for the thousand patents in the
16 portfolio, and the ranking that I use is the
17 number of citations that each patent has
18 received in subsequent -- from subsequent
19 patents at issue in the United States.

20 Q. Well, in your analogy on
21 Thanksgiving dinner, couldn't you just ask
22 people who knew about the folks coming to
23 Thanksgiving dinner, maybe ask some experts how
24 much they might eat?

1 A. Well, you could. But in this
2 case, you face two problems.

3 First of all, it's very difficult
4 to -- we don't have enough time or resources to
5 get experts to rank all of the patents in each
6 party's portfolio based on their importance.

7 And, secondly, there's an element
8 of subjectivity that enters into this. So even
9 if you did ask experts to rank these patents,
10 you're not going to get any two experts to agree
11 on the exact ranking. So you need an objective
12 indicator that does this for you, and get it at
13 least approximately right for all of the patents
14 in the portfolio.

15 Q. And you said the objective
16 indicator was the number of patent citations per
17 patent?

18 A. Yes. That's right.

19 Q. How do you know that's a good
20 measure of importance of patents?

21 A. Well, economists have been working
22 now for more than 20 years on ways of trying to
23 take large groups of patents and figure out how
24 to value portfolios of patents or weigh them in

1 some fashion to reflect their value without
2 having to go through and obtain expert advice on
3 each of the individual patents.

4 Q. So you didn't make this up for
5 this case?

6 A. No. No. No.

7 This approach is more than 20
8 years old. I think it goes back -- I've got an
9 article on the screen. It goes back originally
10 to the classic article by Manual Tracenberg on
11 Patent Citations & Evaluations. That is -- that
12 spawned a whole flurry of research that was on
13 eventually researched in a book published by MIT
14 Press called Patent Citations and Innovations.

15 I've also worked on the methods to
16 weight patents appropriately, so that you,
17 rather than simply counting them, you assign
18 them their appropriate share in total value.

19 Q. Okay. When you first mentioned
20 this to me, what I thought was, well, how about
21 patent citations -- there's going to be a whole
22 lot more for an older patent than a younger
23 patent.

24 So how did you account for that?

1 A. Well, you have to, obviously,
2 adjust for the age of the patent. So in the
3 same way that when you look at your child's
4 height on a height-weight chart and say what
5 percentile does my child fall in, you look at
6 the chart for the -- that corresponds to the age
7 of your child.

8 So my child falls in the 70th
9 percentile for six-year-olds. If your child is
10 eight, then you use a different one, because all
11 eight-year-olds are taller on average than all
12 six-year-olds.

13 So in the same way, we use a
14 different chart that ranks the patents based on
15 its age and adjusts for that fact in computing
16 its overall ranking.

17 Q. So you ranked all the AUO patents
18 in this case?

19 A. All the AUO patents and all the
20 LGD patents. That's right.

21 Q. Okay. So does this ranking of
22 patents, the way you approached it, does that
23 take into account any of the Georgia-Pacific
24 factors?

1 A. Yes. The third factor refers to
2 commercial advantages of invention, the nature
3 of the invention and the benefits, the
4 advantages of the invention over old modes and
5 devices, and so forth. And so the number of
6 citations is correlated with these commercial
7 advantages, because truly pioneering inventions
8 typically spawn other inventions that build upon
9 them and improve upon them.

10 And these later inventions
11 generate citations back to the pioneer. So the
12 number of citations that a patent receives is
13 correlated, on average, with the commercial
14 significance.

15 Q. So once you ranked them, how did
16 you divide them up? Did you just average them?

17 A. No. And the last step, once
18 you've got a ranking from Number 1 to Number
19 1000 or whatever, you have to go back to the
20 economic literature and look at the literature
21 on the distribution of patent values. And that
22 literature says that if you know -- for any size
23 patent portfolio, if you know the number of
24 patents in that portfolio, and you know the

1 ranking of where a particular patent falls in
2 that portfolio, then you can assign a share of
3 the entire portfolio's value, whatever the
4 aggregate value is. You can figure out the
5 share based on the literature on the
6 distribution of patent values.

7 Q. Okay. And so once you have that
8 share, you can determine what?

9 A. Well, basically we've got the size
10 of the pie. We've now got the share of the pie
11 that's attributable to each patent.

12 You multiply those things
13 together, and you get the size the actual piece
14 of the pie that each patent gets. And that's
15 our damages number.

16 Q. And you did that in this case?

17 A. That's correct.

18 Q. For each of the patents?

19 A. For each of the four patents.

20 That's right.

21 Q. All right. So these are the
22 numbers you came up with that value share on
23 that analysis?

24 A. Yes.

1 Q. What if you underrepresented the
2 importance of the patents due to the fact that
3 the patent citation method maybe was unreliable
4 after all these patents were actually chosen to
5 be asserted in this case?

6 A. Yes.

7 Q. You take that into account?

8 A. Well, the -- I know each party
9 says that its patent is among its most important
10 patents. The objective indicator of citations
11 actually doesn't support that claim for any of
12 the patents in this case. They don't rank even
13 within the top five percent of all patents.

14 But, you know, citations are not a
15 perfect measure of commercial significance. And
16 so I assumed instead to, as a check on this, so
17 that each patent fell within the top five
18 percent. And I assigned it a share value that
19 would be appropriate for the average top five
20 percent.

21 So, in other words, I just
22 disregarded citations entirely and said, Let's
23 assume the patent is important, place it in the
24 top five percent and then figure out the value

1 that you would get.

2 Q. So then in your Thanksgiving meal
3 value, you assume the top five percent eaters?

4 A. Yeah, exactly, that are the heavy
5 eaters. Whether they weigh a hundred pounds or
6 400 pounds, we're going to assume they're a
7 heavy eater and assign them the heavy eater
8 sale.

9 Q. Did that change your results?

10 A. Yes, of course.

11 Q. Go to the next slide. And what
12 does this show?

13

14

15

16

17

18

19

20

21 Q. So the two value shares together
22 provide you a range under this method; is that
23 right?

24 A. Yes. That's right.

1 Q. This is the range?

2 A. Yeah. So this just summarizes the
3 results for the two methods for each of the four
4 patents, or I should say two assumptions under
5 the single method for each of the four patents.

6

7

8

9

10 Q. Now, this method industry price
11 method, did you do another method to check these
12 values?

13 A. Yes.

14 Q. And is the other method going to
15 take us as long to go through?

16 A. No. We can actually take
17 advantage of all the work we've done up until
18 now and go -- it goes very quickly.

19 Q. Okay. So what's your other
20 method, Slide 33.

21 A. Well, going back to -- well, I
22 call it the apportionment of LGD's profits. And
23 for the four asserted patents what you want to
24 do is conceptually take a different pie.

1 We're going to change pies and
2 instead of looking at AUO's claim against LG,
3 we're going to look at LG's profits on the
4 accused sales and then apportion that among the
5 four patents.

6 Q. Okay. Now, we've discussed, I
7 think, your group one, group two, and group four
8 of your Georgia Pacific factors?

9 Does this relate to any of the
10 Georgia-Pacific factors?

11 A. The group two --

12 Q. Group two?

13 A. -- is the factor related to
14 profitability. I think it's on the next slide.

15 And so, in particular, we have the
16 established profitability of the patented
17 product and portion of the defendant's profit
18 that's credited to the invention.

19 And this is under Factor 13 as
20 distinguished from the defendant's own
21 contributions. So what we're particularly
22 concerned with here is separating the portion of
23 LG's profits that are attributable to AUO's
24 patents and the portion of LG profits that are

1 attributable to LG's own patents.

2 Q. Okay. You're saying profits a
3 lot. You already said you are going to conduct
4 a reasonable royalty analysis.

5 Is this a lost profits analysis?

6 A. No. These are -- as I said, what
7 I've listed here are the four Georgia-Pacific
8 factors, which are directed to computing a
9 reasonable royalty. But these are four factors
10 that tell us to look at the profits of the
11 patented products and the share of those profits
12 that should be -- that are used as an input in
13 determining what would emerge from a
14 hypothetical negotiation.

15 Q. How would this analysis fit into a
16 hypothetical negotiation?

17 A. Well, you might think of it this
18 way: The first method that I looked at examines
19 negotiations between parties, and that's -- that
20 reflects what a seller is willing to sell its
21 invention for or its portfolio, or in this case
22 four members of its portfolio.

23 Here we're looking at it from the
24 buyer's side. And this reflects what a buyer

1 would be willing to pay as a share of the total
2 profits that the buyer earns for the use of
3 these particular patents.

4 Q. Okay. So what's the first step in
5 your analysis here?

6 A. Well, as I said, we're going to
7 start with LG's profits. And so we're just
8 changing the pie. It took a lot of work last
9 time to get to the appropriate pie.

10 Now, we can read the LG's income
11 statement and simply add those up and figure out
12 what their profits are. So --

13 Q. Did you prepare a summary of the
14 profits --

15 A. Yes, I did.

16 Q. -- in this case?

17 Please turn to AUO 283, please.

18 What is this?

19 A. Well, this is just a standard
20 income statement for the period 2001 through
21 2008 that shows as a top line LG's actual sales
22 worldwide. It subtracts other costs and the
23 bottom line is the profits earned by LG over
24 this period.

1 Q. And did you prepare this
2 information?

3 A. Yes, I did.

4 Q. From publicly available resources?

5 A. Yes.

6 Q. And did you rely on this
7 information in forming your opinions?

8 A. Yes.

9 MR. TYLER: At this time, we'd
10 move to admit AUO 238, Your Honor.

11 THE COURT: It's admitted.

12 BY MR. TYLER:

13 Q. So after you have the profits
14 information, what do you do next?

15 A. Well, the LG's profits are
16 attributable to many factors. Not only just the
17 patents, but other intellectual property and
18 other things that a company like LG does to make
19 money.

20 It's got, you know, the good sales
21 staff. It's got a brand name. It does
22 advertising and that sort of thing.

23 So what I've done is assume
24 conservatively, again, based on economic

1 literature that half of LG's profits are
2 attributable to patents. And so we're going to
3 take the total profits up into two pieces and
4 say half of the profits are -- half of the
5 profits are caused by the patents that it uses
6 in its LCD modules.

7 Q. Past work in your career in
8 looking at parties' profits as they related to
9 patents, did that inform your decision here?

10 A. Yes. I mean, this is actually a
11 conservative assumption. There's some other
12 work that I did that shows that, if anything,
13 the number might be less than this.

14 So I'm assuming conservatively
15 that patents accounted for half of the profits.

16 Q. Okay. And let's turn to AUO 265.
17 And what is this summary?

18 A. This just shows the calculation
19 that takes you from worldwide sales. So on the
20 right-hand side, we have AUO, as the plaintiff,
21 which means we're looking at LGD sales as the
22 defendant.

23 It takes you from worldwide sales
24 subtracts out foreign sales and non-accused

1 sales to get to U.S. sales.

2 Then computes the profits on those
3 sales. Takes half that profit.

4

5

6

7

8 Q. Okay. Thank you.

9 And did you rely on this summary
10 in forming your opinions?

11 A. Yes.

12 MR. TYLER: At this time, Your
13 Honor, we move for admission of AUO 265.

14 THE COURT: Admitted. It's
15 admitted.

16 BY MR. TYLER:

17 Q. Before we leave this, the left
18 side of this is what we're going to see in two
19 weeks; right?

20 A. Yeah. Under the third principle,
21 this is a symmetrical analysis. So we do
22 exactly the same for LGD.

23 Q. So now we have the profits
24 attributable to LGD's patents, and we talked

1 about accused products and we've taken down the
2 size of the pie. What do you do next?

3 A. Well, now, we take advantage of
4 all the work we did previously and simply apply
5 the count, rank and divide method to get the
6 share of those methods that's attributable to
7 each one of the four asserted AUO patents. So
8 it's exactly the same thing.

9 Q. Is there any difference in the way
10 you did the shares for this particular analysis?

11 A. Well, there's only one difference
12 and that is that previously when you were
13 looking at AUO's claim against LGD across the
14 bargaining table, you were ranking the four
15 patents within AUO's portfolio to determine
16 their contribution to AUO's total claim.

17 Now, you're looking at the profits
18 that LG has earned. And so what you want to do
19 is put the AUO patents within the LG portfolio
20 and figure out what contribution to LG's profits
21 AUO's patents made. So you're ranking AUO's
22 patent within LG's portfolio.

23 Q. So your Thanksgiving guests now
24 went over to LGD's table?

1 A. House. That's right.

2 There's a different number of
3 guests and our -- the four patents don't change
4 in size, but their ranking within that set of
5 guests would change.

6 Q. Okay. Did you summarize how you
7 did the value share analysis for the
8 profitability?

9

10

11

12

13

14 Q. Actually go to the -- go to the
15 next slide. That's fine.

16 And on the right side, is this
17 your conclusions?

18

19

20

21
22
23
24

Q. So on the portion on the
profitability side, you have testified before
about this method?

A. Yes, on the count, rank and divide
method, I have testified before.

Q. And in front of which judge?

A. That was -- I mentioned last year
I testified in front of Judge Sleet, and I
testified about this method.

Q. Okay. And so does this have your
conclusions in the case?

A. Yes. This basically summarizes my
opinion as to the damages that one would observe
for one -- the range of damages that in which
the award should fall for each one of the four
asserted patents.

MR. TYLER: Your Honor, we
premarked this conclusion slide as AUO 1576, and

1 we would offer this into evidence right now.

2 THE COURT: It's admitted.

3 BY MR. TYLER:

4 Q. So I want to ask a few questions
5 about your conclusion, sir.

6 A. Okay.

7 Q. Are you telling us that these
8 patents that AUO chose to sue in this case are
9 only worth anywhere from a few thousand dollars
10 to a few million dollars?

11 A. When you say the value of patent,
12 let me be clear what you mean. The objective in
13 this case is to figure out what LG would pay for
14 the right to use these patents in the United
15 States during the damages period. So that's
16 actually a small fraction of these patents'
17 total value.

18 If you think about the entire
19 value of the patent, it's the value over the
20 entire lifetime potentially between all the
21 competitors in the industry, LG is only about
22 one-sixth of the industry, and these damages
23 periods are only about one-fourth of these
24 patents' lives on average, so if you were to --

1 so you got one-fourth of one-sixth of the total
2 value being represented here by these claims of
3 AUO against LG, if you were to multiply that by
4 twenty-four, you get a better estimate of what
5 the value of these patents are as an asset to
6 LG.

16
17
18
19
20
21
22
23 Q. Did you make any sanity checks to
24 make sure that your numbers were right as

1 compared to the numbers LGD is putting up in
2 this case?

3 A. Yes.

4 Q. And what did you do?

5 A. Well, the -- the second principle
6 that I articulated at the beginning is it's
7 important to analyze all the data. So one of
8 the things I did was to go back to what people
9 actually did in this real world to see whether
10 these numbers were consistent with the rates
11 that are paid not for entire portfolios of
12 patents, but when you're actually licensing
13 individual patents.

14 Q. Did you summarize those
15 in-licenses that you now analyzed?

16 A. Yes, I did.

17 Q. I think we looked at the exhibit
18 earlier, turn to AUO 270.

19 We saw this earlier?

20 A. Yes.

21

22
23
24

 Q. What about when LGD bought
 patents, not just license them, did you look at

1 that as well?

2 A. Yes, I did. Again, I think we
3 have seen -- well, there is an exhibit that
4 summarizes that.

5 Q. Let's go to AUO 272, please.

6 What is this summary?

7 A. Well, this is a similar summary
8 which shows transactions that LGD engaged in
9 where they actually purchased the patent. Of
10 course, when you purchase a patent, you're
11 purchasing all the right, title and interest in
12 the patent, you're not just simply licensing the
13 right to use it, so you would expect to pay more
14 for the entire patent.

15 Q. On the far right-hand column you
16 summarize the per patent?

17 A. Yes. Again, we have the actual
18 payment in present value terms.

19 Q. Far right column. Thank you.

20 A. Yes.

21 So this sort of -- this makes it
22 easier to see. You got the number of patents
23 being transacted including some of the patents
24 that have been asserted in this case, the

1 payment that LG made for those patents in
2 present value terms, and then the average
3 payment per patent which is just the total
4 payment divided by the number of patents.

5

6

7

8

9

10

11

12

13 Q. Did you rely on this summary in
14 coming to your conclusions in the case?

15 A. Yes.

16 MR. TYLER: At this time, Your
17 Honor, we would move to admit 272.

18 THE COURT: It's admitted.

19 BY MR. TYLER:

20 Q. Now, Dr. Putnam, in your expert
21 report, you have made a comment about either in
22 this case, the overall case that if Mr. Cobb's
23 valuation method is going to be correct, it
24 needs to apply equally, or if yours is correct,

1 it needs to apply equally. What did you mean by
2 that?

3 A. Well, under the third principle
4 that I mentioned at the beginning this is a
5 symmetrical analysis so each party is sitting
6 across the table pointing patents at the other
7 side. If you're going to -- regardless of the
8 method that you choose to assign value to these
9 patents, it's got to apply equally to each
10 sides' patents against the other.

11 I happen to disagree with all of
12 Mr. Cobb's analysis, but if you were to adopt
13 that analysis, it has to apply symmetrically to
14 AUO as it would to LG.

15 Q. Why should it apply symmetrically,
16 LG patents are worth a whole lot more than
17 AUO's?

1
2
3

18
19
20
21
22
23
24

Q. Were you at Mr. Cobb's deposition?

A. Yes.

Q. What method is he advocating in this case?

A. He says that you should apply a two percent running royalty to each one of LG's asserted patents.

A. Yes.

Q. You did that for your hypothetical negotiation as well?

A. Yes, I did.

Q. In Mr. Cobb's deposition, what type of license did he think that AUO and LGD would agree to if they sat down in the real

1 world?

2 A. He said in the real word that the
3 parties would agree to a worldwide portfolio
4 wide cross license agreement.

5 Q. Did he apply any of the
6 Georgia-Pacific factors to the AUO patents?

7 A. No, he said he didn't.

8 Q. Did he determine an appropriate
9 royalty rate for the AUO patents?

10 MR. CHRISTENSON: Your Honor, I'm
11 going to object to this line of questioning
12 because I think it mischaracterizes Mr. Cobb's
13 testimony. He hasn't testified yet. This goes
14 to the later part of the trial regarding our
15 patents after Mr. Cobb has had an opportunity to
16 offer his testimony.

17 THE COURT: I'll overrule the
18 objection.

19 MR. TYLER: Pardon?

20 THE COURT: I'll overrule the
21 objection.

22 BY MR. TYLER:

23 Q. Did he determine an appropriate
24 royalty rate for AUO's patents?

1 A. He did not.

2 Q. Did he have an opinion as to the
3 appropriate negotiation date for AUO's patents?

4 A. He said he didn't.

5 Q. Did he identify any alternatives
6 to AUO patents?

7 A. He said he wasn't aware of any.

8 Q. Did he have any ideas on how many
9 fundamental patents there were in the LCD
10 industry as a whole?

11 A. He had no idea as to either the
12 number of fundamental patents or the number of
13 any patents.

14 Q. Did he indicate in certain
15 situations that his two percent rate could apply
16 as an appropriate royalty to AUO's asserted
17 patents?

18

19

20

21 He first review any of the
22 literature that you identify to us in the Court.

23 A. He said he hadn't.

24 Q. Did he believe that the patent

1 citations the way you use it could be an
2 objective indicator of the importance of a
3 patent?

4 A. He said it could be an indicator,
5 yes.

6 Q. Is Mr. Cobb here today?

7 A. I believe that he is.

8 Q. Back there in the corner?

9 A. That's right.

10 Q. Now, I talked about effective
11 royalty rates. Let's go to AUO 271. What do we
12 see here?

13 A. This chart shows a matrix of
14 licenses within the LCD industry. So we have
15 seen a version of this previously. Again, the
16 names of all the other competitors have been
17 redacted except for AUO and LGD.

18 What the matrix shows is the
19 payment between the two competitors as the
20 outcome of a -- their actual cross licensing
21 negotiations. The difference is that in this
22 case, I have expressed the payment not as the
23 actual lump sum payment that one party paid to
24 the other, but as a percentage of sales in these

1 agreements. So it's the effective royalty rate
2 or the equivalent to a running royalty rate that
3 you actually observe in the industry.

4 Q. So this is real data in that
5 little square box we see between AUO and LGD,
6 those are all your hypothetical negotiations?

7 A. Yes, that's the effective royalty
8 rate that's implied by the model that I predict
9 as an outcome of the negotiation between LGD and
10 AUO.

11 Q. At various time frames?

12 A. At various time frames, that's
13 where it varies from .17 to .46.

14 Q. And the other royalty rates?

15
16
17 A. Yes, that's right. We have seen
18 this previously, it varies between .1 percent on
19 the low end to the .5 percent on the high end.

20

21

22

23 A. Yes. As you can see the outcome
24 of the model that I presented falls squarely

1 within the range of rates that we observed in.

2

3

4

5

6

7

8 A. Yes, this is across the entire
9 portfolio.

10 Q. What would this tell you about
11 rates for individual patents in the industry?

12 A. Well, again, going back to the
13 pizza analogy, this is the price of the entire
14 pizza, so that acts as a cap on the price that
15 you would pay for a slice of pizza. A slice
16 can't be worth -- in the same way that if a
17 pizza cost \$10, a slice of piece can't cost more
18 than \$10.

19 One of the patents in a portfolio
20 of patents can't be worth more on an effective.

21

22

23

24

1 A. Yes, we relied on LG's actual
2 behavior.

3 Q. And those involve LG patents that
4 are asserted in this case; correct?

5 A. Yes, they have licensed the same
6 patents as part of a portfolio.

7 Q. Does this tell you anything about
8 Mr. Cobb's two percent slice of pizza?

9 A. Well, again, Mr. Cobb thinks that.

10

11

12

13

14

15

16

17

18

19

20

21

22 Provide you any sort of upper
23 bound on what could be an appropriate royalty
24 rate.

1 A. Well, if you were going to assign
2 a running royalty, which again I think is not.

3

4

5

6

7

8

9

10

11

12

13 A. Yes.

14 MR. TYLER: Your Honor, we move
15 271 in evidence.

16 THE COURT: It's admitted.

17 BY MR. TYLER:

18 Q. And did you calculate the accused
19 LGD sales in the case?

20 A. I did.

21 Q. Can we go to AUO 284, please. And
22 what does the summary in 284 provide for us?

23 A. Well, this just shows the royalty
24 base starting with AUO's total worldwide sales

1 over the infringement period.

2 Q. This is for the accused -- the
3 four AUO patents in this case?

4 A. Well, line A just to be clear,
5 line A is total sales worldwide, and then within
6 the US, and we'll get in a moment to what we
7 mean by in the US. Line C is the subset of
8 sales that AUO is accused under these four
9 patents, again worldwide, and then restricted to
10 the US.

11 Q. And the column, the second column
12 there, US sales, what does that show?

13 A. So using the method that I
14 described previously, which found that 24.7.

15

16

17

18

19

20

21

22

23 A. Well, here we have other measures

24 of US sales, so what I have called direct US

1 sales are sales made by the LG parent company
2 into the US, either directly or through its
3 subsidiary, which is referred to as LGPLA.

4 Q. So you calculated the royalty base
5 as not just doing a percentage, but also the
6 evidence shows direct sale into the United
7 States?

8 A. Yes. Yes. These are actual --
9 without going through the two-step leg via China
10 or whatever, these are the transactions that
11 show direct sales into the US.

12 Q. And did you do this for each of
13 the asserted patents?

14 A. Yes, I did.

15 Q. Can you go to the next page of
16 this. And this is Schedule A of this same
17 exhibit. And what does this show?

18 A. Here we have for each of the
19 asserted patents, the corresponding figures,
20 worldwide sales, US sales, estimated by the
21 display search public data source, direct sales
22 measured as the sum of sales into the US plus
23 sales by -- to LG's subsidiary, and then only
24 direct sales into the US.

1 Q. And dividing up these sales, did
2 you have to study the transaction flow of the
3 products into the United States?

4 A. Yes.

5 Q. And did you prepare a summary of
6 the documents or some of the transactions, sales
7 documents that helped you to understand the
8 transaction point?

9 A. Yes, I did.

10 Q. Can we go to the summary of sales.
11 And this has been premarked as AUO 1562. What
12 does it show?

13 A. Well, this is just a summary of
14 documents that show how LG interacts with its US
15 subsidiary and with its US customers in
16 basically documenting how the product ends up --
17 starts out in Seoul and ends up in the US.

18 Q. And did you review these documents
19 in forming opinions in this case?

20 A. Yes.

21 MR. TYLER: At this time, Your
22 Honor, we would move for admission of AUO 1562,
23 which is a summary as well as the underlying
24 documents.

1 THE COURT: Admitted.

2 MR. CHRISTENSON: We reserve our
3 objections.

4 BY MR. TYLER:

5 Q. Can we go back to the previous
6 slide, exhibit AUO 284. And go to the schedule
7 A. So if you're going to -- if you're going to
8 apply Mr. Cobb's analysis, what's the math that
9 you do?

10 A. Well, here we have the US royalty
11 base for accused products under each one of the
12 four patents. So if you were going to take --
13 use Mr. Cobb's method, which is to multiply a
14 royalty base times a royalty rate, then this
15 gives you the appropriate royalty bases that you
16 would multiply that rate by, once you resolved
17 the question of what constitutes a US sale.

18 Q. So direct infringement would be
19 multiplied by the third column?

20 A. Yes.

21 Q. And inducement theory on the
22 second column?

23 A. Yes.

24 Q. You're not opining on inducement,

1 are you?

2 A. No. That's a liability question
3 and I have no opinion about that.

4 MR. TYLER: We at this time move
5 284 into evidence, this particular slide we have
6 been looking at, Your Honor.

7 TH COURT: It's admitted.

8 BY MR. TYLER:

9 Q. So I'm just about through,
10 Dr. Putnam. We have covered a whole lot today.
11 But I do want to take us back to where we
12 started. Is your analysis based on
13 Georgia-Pacific factors?

14 A. Yes, that's right.

15 Q. Have you prepared a brief summary
16 about that?

17 A. Yes. I think if you go back to
18 the four principles that I articulated.

19 Q. Did you prepare a summary of all
20 your exhibits in this case?

21 A. The exhibits, yes. I'm sorry, the
22 Georgia-Pacific, yes, I did.

23 Q. AUO 294, please.

24 And what is this summary?

1 A. Well, here I have just grouped the
2 fifteen Georgia-Pacific factors as I have said
3 previously into, you know, licensing conduct and
4 so forth. I have listed the individual factor
5 and then summarized the evidence in my
6 conclusions with respect to that factor.

7 Q. And did you rely on this
8 information in forming your opinions?

9 A. Yes.

10 MR. TYLER: At this time we move
11 AUO 294 in evidence, Your Honor.

12 THE COURT: It's admitted.

13 BY MR. TYLER:

14 Q. So let's go back to your final
15 slide, slide 38. Now, you provided a range for
16 potential hypothetical licenses, what you would
17 pay for that. Do you have any guidance for the
18 Court in actually picking a number, an actual
19 number for the damages?

20 A. Yes. I think the number should
21 fall obviously within the range I have
22 articulated. Of course, you have to acknowledge
23 there are limits of your prediction with respect
24 to measuring the value of the patents in this

1 case, so the Court will have also -- has heard
2 and will continue to hear evidence on the
3 commercial advantages and the technical
4 advantages of each of these inventions.

5 So what I would do is weigh that
6 evidence and within the range move toward the
7 lower or the higher end of the range depending
8 on the Court's aggregate determination as to the
9 importance of that invention relative to its
10 alternatives based on the rest of the technical
11 evidence.

12 Q. And can you summarize for us why
13 it is that you think a range of a few thousand
14 dollars to a few million dollars would be the
15 appropriate hypothetical payment that LGD would
16 make to AUO for the individual patents?

17 A. Well, I think it's important to go
18 back to the principles I articulated in the
19 beginning in evaluating these conclusions. The
20 first one is that the best prediction of what
21 people would do in a hypothetical negotiation is
22 what they actually have done. And so when you
23 look at their cross license agreements as well
24 as their one-way agreements that they have

1 actually entered into, the numbers that I
2 proposed are exactly consistent with the actual
3 agreements.

4 Secondly, you have to analyze all
5 the data, which means that you have to look not
6 only at the four asserted patents in a vacuum,
7 but you have to look at them as part of a
8 portfolio and look at all the agreements
9 pertaining to all the patents and not just
10 cherry pick a few.

11 The third principle is that the
12 analysis has to be symmetric, so it has to apply
13 equally when you're sitting on AUO's side of the
14 table as it does when you're sitting on LGD's
15 side of the table. And the analysis that I
16 proposed exactly does that and comes up with --
17
18
19
20
21

22 Portfolio, and so the whole acts
23 as a ceiling on the parts, and the parts have to
24 add up to the whole. And again, if you add up

1 these numbers and did the same thing for all of
2 AUO's patents, what you would get is the whole
3 of AUO's claim or the whole of LG's profits, and
4 that's an important conceptual and practical
5 constraint in evaluating whether these numbers
6 are accurate or not.

7 Q. Now, you're going to be back here
8 in a few weeks testifying about LGD's case, and
9 how are you going to square then what you're
10 doing now?

11 A. Well, the method that I'm going to
12 use is going to be exactly the same. We'll do
13 the same calculations and, but obviously the
14 data will change because in that case we'll be
15 talking about the four LG patents, we'll be
16 talking about AUO's royalty base, we'll be
17 talking about the share of value that LG's
18 patents command as a fraction of LG entire
19 portfolio. So the method will be identical.

20 For that reason, though, it's
21 important to emphasize that the conclusions that
22
23
24

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24

THE COURT: All right. I think we'll take a little break here and come back in fifteen minutes.

(A brief recess was taken.)

THE CLERK: All rise.

THE COURT: All right. Be seated, please.

Ready to proceed?

MR. CHRISTENSON: Thank you, Your Honor.

BY MR. CHRISTENSON:

Q. Dr. Putnam, good morning.

A. Good morning, Mr. Christenson.

Q. Now, to value AUO's claim, you first estimated the value of AUO's entire portfolio measured against accused U.S. sales of LG Display; correct?

A. Well, when you say the "entire portfolio", I measured the value of AUO's portfolio as directed against LG. That's right.

1 Q. Right. And can we see your Slide
2 25, please?

3 Your Slide 25 summarizes that
4 conclusion?

5 A. Yes, that's right.

6 Q. And based on your analysis and the
7 formula that you used, the fair maximum value in
8

9
10

11 Q. And as part of your analysis, you
12 also considered the value of each party's R & D
13 stock over time; right?

14 A. I -- I did that as a check to
15 estimate the value of the entire portfolio as
16 against all competitors worldwide. Yes.

17 Q. Let's look at your Exhibit 19 to
18 your expert report. This is your calculation of
19 AUO's R & D stock value over time; right?

20 A. Yes.

21 Q. And if we look at the year 2006,
22 you have the value you calculated for AUO's R &
23 D stock as \$443 million?

24 A. That's correct.

1 Q. You did a similar analysis for LG
2 Display?

3 A. That's right.

4 Q. That's your Exhibit 20?

5 A. That's right.

6 Q. In Exhibit 20, we can see that you
7 calculated for the same year 2006, the value of
8 LG Display's research and development stock at
9

10

11

12

13

14 A. Yes.

15 Q. And, again, for that same year,
16 you valued LG Display's R & D stock at in excess
17 of \$2 billion; correct?

18 A. That's right.

19

20

21

22 Q. But you didn't start to credit LG
23 Display's R & D stock until 2002; correct?

24 A. I didn't have the data. That's
right.

1 Q. So you didn't intend -- you didn't
2 intend to give AUO a two-year head start there;
3 that was just based on the data you were able to
4 find.

5 A. That's right. And based on level
6 of expenditures, the numbers by 2007 would be
7 essentially the same. But you're right, I
8 didn't -- I did the best that I could with the
9 data that I had.

10 Q. And let's look at a slide
11 reflecting your analysis of R & D stock values
12 between 2002 and 2007, you calculated that LG
13 Display's R & D stock had substantially
14 increased in value over time; right?

15 A. Well, they both have. But, yes,
16 proportionally it's about the same.

17 Q. LG Display's R & D stock has
18 substantially increased over time; right?

19 A. It has substantially increased.
20 Yes, that's right.

21 Q. And even giving AUO that two-year
22 head start, LG Display's R & D stock value is
23 about four times larger than AUO's R & D stock
24 based on your calculations; correct?

1 A. As of 2007, that was true. Yes.

2 Q. Dr. Putnam, you testified about
3 your predicted outcome of a hypothetical
4 cross-license of all patents on AUO and LG
5 Display's entire portfolios; right?

6 A. Yes.

7 Q. And I think Slide 22 that you
8 presented addresses that analysis; is that
9 right?

10 A. Yes. That's right.

11 As of 2004.

12 Q. So this shows your model, your
13 economic model of formula that you used to
14 predict the outcome or what might have happened
15 several years ago; right?

16 A. At the time of the hypothetical
17 negotiation, yes.

18 Q. In 2004?

19 A. That's correct.

20 Q. And we agree, Dr. Putnam, that in
21 any cross-license deal between AUO and LG
22 Display, AUO would have to pay LG Display;
23 right?

24 A. Well, when you say "would have

1 to", I think what you're saying -- what you mean
2 to say by that is that the model would predict
3 that.

4 And based on the characteristic of
5 the parties, I would agree with that statement.
6 Yes.

7 Q. So AUO would have to pay LG
8 Display a lump sum balancing payment, a running
9 royalty, or some combination of those two;
10 correct?

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24

A. That sounds right.

Q. And the '506 patent issued in August 2006?

A. Sounds right.

Q. And in a more recent cross-license, say in 2007, AUO would pay more money than that to LG Display; right, based on your model?

A. Yes, that's correct.

Q. Because from 2004 through 2007, LG Display's patent portfolio has substantially increased in size?

A. Well, yes, both sides are increasing the size of their patent portfolios. And so what happens is that each side's claim against the other is increasing, and the net of that is that the balancing payment would increase.

Q. And so you agree with me that from 2004 through 2007, LG Display's patent portfolio has substantially increased; right?

A. Yes. Again, I think that AUO's is actually increasing at a faster rate, but your

1 statement is correct.

2 Q. Well, we'll get to that, but -- in
3 a moment. But this chart reflects the growth of
4 LG Display's patent portfolio over time; right?

5 A. Yes.

6 Q. And in your analysis, one of the
7 things you considered is the number of patents
8 that each side owned at the time of the
9 hypothetical negotiation on a cross-license?

10 A. That's right.

11 Q. And since 2004, Dr. Putnam, LG
12 Display's patent portfolio of U.S. patents
13 reflected in this chart has substantially
14 increased every year; right?

15 A. Yes.

16 Q. And as the portfolio size has
17 increased, the value of LG Display's portfolio
18 also has increased over time; right?

19 A. I would expect that, yes.

20 Q. In fact, your analysis proves
21 that; right?

22 A. Well, that's --

23 Q. Your Exhibit 15.1 confirms that;
24 right?

1 A. As -- yeah, I think. I don't
2 remember the exhibit number off the top of my
3 head.

4 But, yes, as the portfolio size
5 increases, the number of arrows in your quiver
6 goes up. Then the value of your portfolio goes
7 up. That's true as a general statement.

8 Q. You mentioned a minute ago, you
9 also looked at the number of patents that AUO
10 acquired over time; right?

11 A. Yes.

12 Q. And you acknowledged, in your
13 direct testimony, that some of the patents
14 weren't actually owned by AUO at the time that
15 you listed them; right?

16 A. Well, at the time that they
17 issued, they were not owned by AUO, but AUO
18 acquired them. They acquired the right to sue
19 for past damages.

20 So they, in effect, acquired the
21 benefit of the issue date. But it's true, they
22 weren't in AUO's possession as of that date.

23 Q. But you still credited them as if
24 they were in AUO's possession as of that date;

1 right?

2 A. For the purpose of the outcome of
3 the hypothetical negotiation, yes, because they
4 represent a claim against another party in this
5 case, LG.

6 Q. Well, at the time they were
7 acquired, they weren't asserted against LG, were
8 they?

9 A. No, but AUO acquired the right to
10 sue LG for damages going back to the issue date.

11 Q. And all of those acquired patents
12 are not involved in this case, are they?

13 A. I think there's only two.

14 Q. Now, since 2004, again, looking at
15 the slide, the size difference between LG
16 Display's portfolio and AUO's portfolio has
17 increased over time; right?

18 A. Well, it depends on how you
19 measure. I would look at the ratio.

20 And the ratio when we start out
21 about being three times as big and now it's
22 about two and a half times as big. So actually,
23 relatively speaking, the difference has shrunk.

24 But absolute terms, you're right.

1 Q. In terms of actual numbers,
2 Dr. Putnam, the size number has increased?

3 A. In terms of actual numbers, that's
4 correct.

5 Q. Because in 2004, the time that you
6 did your hypothetical cross-license model, LG
7 Display had 524 more U.S. patents than AUO;
8 right?

9 A. That's right.

10 Q. And in 2009, LG Display has 1,570
11 more U.S. patents than AUO; correct?

12 A. It looks -- the figures look right
13 to me.

14 Q. And, again, at the time -- at the
15 time of the hypothetical negotiation that you
16 did for cross-licenses on all patents, 2004, LG
17 Display owned, you say, 789 U.S. patents; right?

18 A. Yes.

19 Q. But by 2006, LG Display's U.S.
20 patent count, according to you, had increased to
21 1,620 U.S. patents?

22 A. I think that's right.

23 Q. So by 2006, LG Display had more
24 than doubled the number of U.S. patents that LG

1 Display had on the date you used for the
2 hypothetical cross license?

3 A. As had AUO, that's right.

4 Q. And, again, your research suggests
5 that as the number of patents in a portfolio
6 increases, the royalty rate for that portfolio
7 increases at an almost linear rate; isn't that
8 right?

9 A. All things equal, that's the way
10 that people in the industry behave. That's
11 true.

12 Q. So we agree, again, that AUO's
13 balancing payment to LG Display today would
14 certainly be more than a balancing payment that
15 you illustrated in 2004; right?

16 A. Well, if you were predicting based
17 on the characteristics of the model, I think
18 that would be true. Obviously, that's not a
19 question that I addressed as part of damages,
20 which are retrospective and determined on the
21 date of hypothetical negotiation.

22 But that would be an implication
23 of the model if you were to apply it today.

24 Q. And given the fact that two of

1 AUO's patent didn't issue until after 2004, it
2 could be appropriate to do a hypothetical
3 negotiation looking at more recent data when
4 those patents actually existed; right?

5 A. And that's what I did. The
6 exhibit -- I also calculated this for 2006, and
7 as you pointed out, the balancing payment as
8 well as each side's claim against the other are
9 larger in 2006 than in 2004.

10 Q. And the net difference increases
11 in favor of LG Display over time as well;
12 correct?

13 A. Well, when you say "net
14 difference", I think if you mean -- if you mean
15 the balancing payment increases, then the answer
16 is yes.

17 Q. Yes. Now, Dr. Putnam, you did a
18 very interesting study regarding which companies
19 in the LCD industry owned the most significant
20 LCD patents; do you remember that?

21 A. Yes.

22 Q. And you briefly alluded to that.
23 I'd like to explore that a little bit more in
24 detail with you.

1 That was your Exhibit 11.1 to your
2 report; correct?

3 A. Yes.

4 Q. Let's look at redacted Exhibit
5 11.1?

6 Let's take the blow up off for
7 just a second. So looking at this redacted
8 version of Exhibit 11.1, can we increase that a
9 little bit -- again, this is an exhibit that you
10 prepared as part of your analysis; correct?

11 A. Yes.

12 Q. And the title of your -- the title
13 of your Exhibit 11.1 at the top is you
14 characterize this as the rate of patent
15 portfolio strength and balancing payments for
16 cross licenses in the industry; right?

17 A. That's right.

18 Q. You did this to rank the patent
19 portfolios of AUO and other LCD companies;
20 correct?

21 A. Well, I ranked -- I computed the
22 number of top five percent patents that each
23 firm had, that's right.

24 Q. Just to step through your

1 analysis. To do your ranking of which -- you
2 did a ranking of which companies own the top LCD
3 patents; right?

4 A. As measured by patent citations,
5 that's correct.

6 Q. And you evaluated approximately
7 9,000 LCD patents based on number of citations
8 adjusted for age; correct?

9 A. That's right.

10 Q. And that allowed you, Dr. Putnam,
11 to identify the top five percent or roughly 450
12 top LCD patents?

13 A. Again, that's correct.

14 Q. And you then determined how many
15 of each of those top five percent patents is
16 owned by nine LCD companies identified in your
17 Exhibit 11.1; correct?

18 A. Yes.

19 Q. And the heading here on the
20 left-hand side of your Exhibit 11.1 is 95th plus
21 percentile patents; right?

22 A. Yes.

23 Q. So again, we're talking about the
24 top five percent of all LCD patents?

1 A. That's correct.

2 Q. And this shows the -- this Exhibit
3 11.1 shows the negotiating positions of the
4 various LCD companies relative to each other;
5 correct?

6 A. Well, what it shows is the list of
7 top five percent patents that one might think
8 that the number of -- one hypothesis would be
9 that the more important patents that a company
10 has, the better its bargaining position.

11 I actually used this to estimate
12 my model and I found that it didn't pick the
13 data as well as simply using all the patents in
14 the portfolio.

15 So while the hypothesis is
16 plausible, it doesn't fit the data as well.

17 Q. Dr. Putnam, as you already
18 testified on direct, the weaker party pays the
19 stronger party in a cross license; right?

20 A. Yes.

21 Q. And this is a way to assess which
22 parties are stronger and which parties are
23 weaker; right?

24 A. By one measure, yes.

1 Q. And this is the measure you used;
2 correct?

3 A. Sure.

4 Q. This is your measure?

5 A. Yes.

6 Q. And as part of your measure, you
7 determined that at the top on the left, LG
8 Display owns 80 of the top LCD patents in the
9 world; correct?

10 A. That's what I estimated, yes.

11 Q. And if you look down toward the
12 bottom, you can see you estimated that AUO owns
13 only sixteen of the top LCD patents; correct?

14 A. Yes.

15 Q. And just to be clear, none of
16 those sixteen patents are in this case; right?

17 A. I'm not sure that that's true.
18 There may be one AUO patent that made the top
19 five percent, so I'm just not sure. It's no
20 more than one, and it may be zero.

21 Q. Did you testify in your deposition
22 that none of the sixteen AUO patents are
23 involved in this case?

24 A. Yeah, I did say that. And then I

1 went back and actually looked at the data and
2 see where they rank, but I hadn't looked at any
3 of the individual patents. Once we selected the
4 patents for trial, I think I did see that. I
5 think I remember seeing in retrospect one of the
6 patents appearing in the top 96th percentile.
7 It won't make any difference in my conclusion,
8 so I won't fight you on -- that was my
9 impression at the time and my opinions don't
10 change whether it's true or not true.

11 Q. But in any event, LG Display,
12 according to these calculations that you did,
13 owns five times as many top LCD patents as AUO
14 owns; right?

15 A. Your arithmetic is correct.

16 Q. And this is a way that you ranked
17 LG Display and AUO in terms of their patent
18 portfolio strength and value?

19 A. Well, I wouldn't say that it's a
20 way that I ranked the portfolio value, it's a
21 way of ordering the company to explain the
22 effective royalty rate that they pay in the
23 industry. And it turns out that the rates that
24 they pay are consistent with this ranking. But

1 I wouldn't go further than that.

2 Q. Well, previously you went a little
3 further. You gave a deposition in this case on
4 April 22nd, 2009, that's when I deposed you;
5 correct?

6 A. Yes.

7 Q. And on page 184, line 18, didn't
8 you testify as follows, Dr. Putnam:

9 "QUESTION: So this is a way to
10 rank" -- we were talking about Exhibit 11.1, you
11 remember testifying on Exhibit 11.1 at your
12 deposition?

13 A. Yes.

14 Q. "QUESTION: So this is a way to
15 rank LCD companies in terms of their patent
16 portfolio strength and value?

17 "ANSWER: Broadly speaking, I
18 would agree with that statement."

19 Was that your testimony?

20 A. Yes. And it's still true.

21 Broadly speaking I still agree with it.

22 Q. So broadly speaking, this is a way
23 to rank LG Display and AUO in terms of their
24 patent portfolio strength and value; correct?

1 A. For the purpose of analyzing the
2 rates they actually pay in the industry, yes.

3 Q. And as shown in your Exhibit 11.1,
4 LG Display holds one of the top portfolios in
5 the industry; right?

6 A. It ranks near the top of that
7 list, yes.

8 Q. And AUO, sir, is listed seventh
9 out of nine LCD companies; correct?

10 A. That's true.

11 Q. In fact, the only companies lower
12 than AUO in patent portfolio strength and value
13 are CMO and CPT; correct?

14 A. On that list, that's true.

15 Q. On your list; correct?

16 A. Yes.

17 Q. Now, you looked at actual cross
18 licenses; right, existing cross licenses in the
19 industry?

20 A. Yes. That's what's redacted from
21 the table.

22 Q. And slide 19 that you just
23 presented on direct provides some dollar amounts
24 related to actual licenses; right?

1 A. That's true.

2 Q. So your slide 19 list the cross
3 licenses between LCD companies?

4 A. Well, in particular it shows the
5 balancing payments paid by one of the parties to
6 the other, that's right.

7 Q. And you identify the parties to
8 those cross licenses in your slide six? Let's
9 look at your slide six.

10 A. This is not a complete list, but
11 yes, that's right.

12 Q. These are six of the eight that
13 you looked at; right?

14 A. Yes.

15 Q. And you looked at specifically for
16 AUO, AUO's cross licenses with Sharp, with
17 Samsung, with Hitachi; right?

18 A. Yes.

19 Q. Now, Dr. Putnam, in each of those
20
21
22

23 Q. In all of AUO's licenses, AUO has
24 always paid the other party; isn't that right?

1 A. Among cross licenses within the

2

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19 A. The ultimate objective is to award
20 damages to those four individual patents, that's
21 true.

22 Q. So you're trying to predict the
23 value of AUO's claim on its four asserted
24 patents; right?

1 A. I wouldn't say predict, but yes, I
2 am trying to measure the value, that's right.

3 Q. And you concluded that if all four
4 of AUO's patents are valid and infringed, then
5 AUO should recover somewhere between \$100,000
6 and \$6 million; right?

7 A. I said that was the most likely
8 range, that's correct.

9

10

11

12 Q. And that range is based on the
13 four separate estimates you calculated for each
14 of AUO's patents-in-suit?

15 A. That's right.

16 Q. So for each of AUO's asserted
17 patents, you calculated a royalty range based on
18 four separate estimates; right?

19 A. Yes.

20 Q. You used two, what you called
21 method one estimates and two method two
22 estimates?

23 A. There is two estimates and then
24 for each estimate there are upper boundaries.

1 Q. There are two assumptions for each
2 estimate?

3 A. That's right.

4 Q. There is the assumption that you
5 think should apply and then there is the top
6 five percent value assumption?

7 A. That's right.

8 Q. And that's summarized in AUO
9 Exhibit 1564; right, your estimates?

10 A. If that's the slide that describes
11 my damages conclusions, then yes.

12 Q. So let's look at AUO Exhibit 1564.
13 And you calculated as you stated on direct, you
14 calculated ranges of royalties for each patent,
15 you're not offering a specific dollar amount; is
16 that right?

17 A. Well, it's a very precise range,
18 but you're right, within that range I have no
19 particular preference.

20 Q. And it may be precise, but it is
21 fairly broad; right?

22 A. No, actually I disagree. It's
23 within, typically within a few hundred thousand
24 dollars from the top end to the bottom end.

1 Maybe as much as a couple of million, but you
2 know, that's given the quantity of sales at
3 stake here, that's actually -- particularly
4 relative to LG's claim, it's incredibly precise.

5 Q. Well, let's be precise. Let's
6 look at where your royalty ranges start for each
7 of AUO's four asserted patents.

8 For the '629 patent, your royalty
9 range starts at \$22,000; isn't that right?

10 A. Yes.

11

12

13

14

15

16

17

18

Q. And if we look at some totals and some averages, we can get I think another sense of your valuation of AUO's claims. This is a slide that summarizes your conclusions providing some totals and some averages. Do you see that? Do you see that slide?

A. I see the slide. I don't understand it yet, but I'm sure you'll explain it to me.

Q. I'll do my best.
If you look at the headings, method one, industry price, and method two, apportionment, those are your method one and

1 method two approaches; right?

2 A. Yes.

3 Q. And then for each of the four
4 patents listed in this slide, I have set forth
5 the four damages estimates that you have
6 provided for each patent. Do you see that?

7 A. Yes.

8 Q. So again, we have two method one
9 estimates and two method two estimates; right?

10 A. Yes, that's right.

11 Q. And then at the bottom along the
12 total column at the bottom, the total row, I
13 have added the four numbers in each of your four
14 estimates. Do you see that?

15 A. Yes.

16 Q. So at the starting point, your
17 first royalty estimate for all four patents in
18 suit, the total is \$45,500; correct?

19 A. Yes, it looks like you have added
20 that correctly.

21

19
20
21
22
23
24

A. Based on the objective data,
that's true.

Q. And so and each of these, method

1 one and method two ranges, the first number
2 gives the value share for the four patents that
3 you think actually applies; right?

4 A. That's correct.

5 Q. And the second number, the second
6 estimate for method one and method two is the
7 top five percent value assumption that you don't
8 think actually applies; right?

9 A. Well, if one were to disregard the
10 citation data and simply take the parties at
11 their word that these are among the most
12 important patents, then that would apply. So
13 I'm trying to offer alternative ways of
14 summarizing the data citation, data -- the
15 objective indicators. They're limited.

16 Obviously, the parties attach some
17 weight to these patents, because they've
18 taken -- undertaken the expense to bring them
19 into Court. So I think that's also a factor to
20 consider.

21 And so I wouldn't say it
22 doesn't -- that it doesn't apply. I would say
23 that it ignores the objective evidence.

24 Q. And your opinion is that we need

1 to rely on the objective evidence; right?

2 That's important, isn't it? Isn't
3 that the reason you used citation rankings?

4 A. I would say you rely on it, not
5 solely. You rely on it, because it's the best
6 way of ranking all the patents in both parties'
7 portfolio.

8 Well, which now are over 3000. So
9 it's the best available measure for the exercise
10 at hand.

11 Given that it may not be perfect,
12 it's important to provide a check on that or,
13 you know, basically ask yourself a question:
14 How wrong can I be? And so if the answer is
15 that we have to throw out that, then we throw it
16 out. And we have -- it's improved.

17 Q. But using your objective indicator
18 of value, which you think is the most
19 appropriate approach, the real range of value?

20
21
22
23
24

1 A range there. But if you impose that
2 restriction, yes.

3 Q. And if AUO cannot prove
4 infringement for all four patents, AUO's claim
5 loses value off of those numbers; right?

6 A. That's true by definition.

7 Q. And by definition, if any of AUO's
8 asserted claims is invalid, then AUO's claim
9 loses value; correct?

10 A. I think that's also true by
11 definition.

12 Q. In fact, your average royalty for
13 the '157 patent, for example, is only \$174,250;
14 correct?

15

16

17

18 Average for that range. But
19 that's a number you've calculated.

20 Q. And --

21 A. The more appropriate thing would
22 be to take the average of the low end and the
23 average of the high end, and then pick some
24 number in between.

1 So that would be the appropriate
2 thing to do. But if you treat them as four
3 independent numbers, then it's the 174,000.

11 THE COURT: All right. Thank you.

12 MR. TYLER: I have no further
13 questions, Your Honor.

14 THE COURT: All right. Thank you,
15 Doctor.

16 MR. SHULMAN: AUO rests.

17 THE COURT: All right. Thank you.

18 MR. BONO: Your Honor, I assume
19 all motions are reserved until post-trial
20 motions?

21 THE COURT: We'll assume that you
22 would interpose the appropriate motions at this
23 time, and so your position is reserved. And
24 they can become part of the post-trial briefing.

1 There's no objection?

2 MR. SHULMAN: No. I was wondering
3 how if you granted the motion, you would take
4 the case away from yourself.

5 THE COURT: That's what I was
6 thinking.

7 Okay. Mr. Bono.

8 MR. BONO: Yes, Your Honor. We're
9 ready to proceed.

10 We would call Dr. Rubloff as our
11 next -- first witness. Mr. Goodwyn will present
12 the witness.

13 THE CLERK: Sir, do you want to
14 swear or affirm?

15 THE COURT: You know, while we're
16 doing this, if we can get Mr. Tyler and Mr.
17 Christenson. Is Dr. Putnam still here?

18 MR. SHULMAN: Yes, he's here.

19 THE COURT: Could he just come up
20 to side-bar for a mini -- lawyers that want to
21 come, at least those two -- to conduct a mini
22 examination.

23 (Beginning of side-bar
24 conference:)

1 BY THE COURT:

2 Q. I was going to save this, because
3 I know I'm going to see you again, but I thought
4 I'd ask it now.

5 A. Sure.

6 Q. So we have the hypothetical
7 negotiation?

8 A. Yes.

9 Q. And we have your model to apply to
10 that negotiation?

11 A. Yes.

12 Q. And understanding all the data
13 that you've relied on and the premises of that
14 model, --

15 A. Yes.

16 Q. -- in your opinion, why haven't
17 these parties been able to negotiate on the
18 basis of your model?

19 Let me just expand a little bit --

20 A. Mm-hmm.

21 Q. -- away from the patents-in-suit
22 here. But why haven't they been able to
23 negotiate a worldwide license, a cross-license?

24 A. Well, it's an excellent question,

1 Your Honor. And, of course, I'm not privy to
2 all their actual negotiations, so I am speaking
3 without full knowledge.

4 What I can say is that LG's
5 damages claim, the alleged aggregate value of
6 the claim is about \$700 million. And so whereas

1 conclusion and having some appreciation for the cost
2 of patents, you having some appreciation for the cost
3 of patent litigation, is that -- does that cost make
4 any sense to you, as an economist, under any theory
5 that you can conjure up?

6 A. I understand your question. I
7 think I understand your question. And --

8 Q. Well, there's a certain cost to
9 engage in this litigation.

10 A. Yes.

11 Q. And typically, you know, we'll
12 have patent cases where parties will spend 20,
13 \$25 million, but they're going after a \$12
14 billion a year industry.

15 A. Yes.

16 Q. Even I understand that. 25
17 million, 12 billion a year.

18 A. Right.

19 Q. I understand. With the numbers
20 here and what we've been hearing in this
21 commercial marketplace, and in this competitive
22 arena, does the typical cost of patent
23 litigation make sense to you, as an economist,
24 in the context of the numbers you're proposing?

1 A. Yes. I do understand your
2 question.

3 And it's clearly the case that if
4 you were to award AUO the full damages that I
5 have recommended, AUO would not recover its
6 litigation costs.

7 And in two weeks when I testify
8 about LG's claim, I expect that LG would not
9 recover its litigation costs based on the
10 damages that I recommended for LG.

11 Q. So does that kind of push us back
12 into your thought that this might really be
13 about the deflecting competition early on, or
14 does it give us some other lead to another
15 theory that would make sense to you, again as an
16 economist, or a damages expert?

17 A. I think there are two answers.
18 First of all, it may very well be worthwhile,
19 because Your Honor obviously has the power to
20 injoin an injunction, an incredibly important
21 weapon in a negotiation.

22 And so often times in litigation,
23 the damages are really a sideshow to the
24 equitable relief that the Court is expected to

1 award and the parties bargain over that.

2 The other --

3 Q. Let's assume here it would be just
4 like cross-licensing. It would be
5 cross-injunctions. So it would put everybody
6 out of business?

7 A. Yes, that would -- that --

8 Q. You and I would work in the LCD
9 business.

10 A. That's right. Well, that's
11 obviously an incentive for both parties to
12 negotiate, if you were to award that.

13 The other thing I think it's fair
14 to say is that damages award -- well, my
15 opinion, as an economist, is that there's very
16 little science that goes into damages award.

17 I've spent a lot of my
18 professional life trying to more accurately
19 value patent rights, so that you don't have a
20 situation where somebody can go into Court and
21 ask for the moon and then settle outside of
22 Court for pennies on the dollar.

23 That's often what you see
24 happening. There's no relationship between what

1 parties actually pay in the marketplace and what
2 they say in the courtroom.

3 That's a -- that's a frustration
4 in my business, because I'm privy to the
5 settlement negotiations. I know what parties
6 settle for.

7 And then I also see what they ask
8 for in the courtroom, which may be a hundred
9 times that. Insofar as the possibility exists
10 that one party can come into this Court and make
11 a very large claim that can -- it may not vary
12 in a relationship to the truth, but there's a
13 chance of a jury, in particular, never having
14 seen these numbers before, a chance of a jury
15 awarding that large number. And that the
16 prospect of that large award influences both the
17 conduct of the litigation and the settlement
18 negotiations.

19 So while I have done the best that
20 I can to actually measure the value in the
21 marketplace from real transactions about the use
22 of these patents, there's no question that in a
23 courtroom juries have awarded amounts that bear
24 no relationship to those actual transactions.

1 And if you thought you could get a
2 jury to do that, you might proceed to trial on
3 the chance that you'll win the lottery and
4 receive something that you wouldn't get at the
5 bargaining table.

6 THE COURT: Okay. It's your
7 witness. Did you have anything you wanted to
8 ask about what I've asked?

9 MR. TYLER: That's great. I'm
10 fine.

11 THE COURT: Mr. Christenson?

12 MR. CHRISTENSON: No questions.
13 Thank you, Your Honor.

14 (Conclusion of side-bar
15 conference.)

16 THE CLERK: Please state and spell
17 your full name for the record.

18 THE WITNESS: Gary Wayne Rubloff.
19 G-A-R-Y, W-A-Y-N-E, R-U-B-L-O-F-F.

20
21 GARY WAYNE RUBLOFF, PH.D.,
22 the deponent herein, having first
23 been duly sworn on oath, was
24 examined and testified as follows:

1 DIRECT EXAMINATION

2 BY MR. GOODWYN:

3 Q. Good morning, Dr. Rubloff.

4 A. Good morning.

5 Q. Were you asked to form opinions
6 regarding AUO's '629 patent?

7 A. Yes, sir, I certainly was.

8 Q. Before we get into explaining your
9 opinions, can you briefly describe your
10 education and work experience?

11 A. Yes. I took my bachelors, masters
12 and Ph.D. degrees from the University of Chicago
13 in physics. I then did a post-doctoral
14 researcher appointment at Brown University which
15 led me into the area of surface and interface
16 science.

17 And in the course of the
18 professional experience that I've had, I have
19 published about 200 papers. I've -- let's see,
20 I missed the -- excuse me.

21 Q. I apologize.

22 A. I have had twenty patents issued
23 in the areas of electronic materials,
24 manufacturing processes, and testing in

1 semiconductor technologies. And I'm a fellow in
2 two professional societies.

3 Q. Can you also explain some of your
4 work experience?

5 A. Yes. After I finished my
6 post-doc, I went to IBM Research Center in New
7 York for twenty years where I started as a
8 research staff member in the science areas, and
9 gradually got involved looking at IBM
10 semiconductor technology and trying to elucidate
11 some of the important factors in materials and
12 processors for those technologies.

13 In about 1985, I spent a very
14 special year of my career as technical assistant
15 to the vice-president for logic and memory, who
16 later became IBM's chief scientist. And I
17 emphasize that because it changed my career. It
18 led me into technology areas as you see, I went
19 into management, senior management of silicon
20 technology, and I managed thin film process
21 modeling in the manufacturing research
22 department.

23 But the perspective that I gained
24 in that, I always say that was the best year of

1 my career, is that I was able to see many
2 technologies across the spectrum that IBM had at
3 the time.

4 My job was in substantial part to
5 do the homework of the chief -- of the VP in
6 preparing the ten-year technology outlook for
7 the company which he then presented to corporate
8 management board.

9 That gave me a chance to see
10 gallium cyanide silicon, optimal electronics,
11 storage displays and other technologies and to
12 work with the directors of all of those
13 divisions. As it happened, it was also my first
14 introduction to LCD technology because I
15 remember very well a tasks force that was going
16 on at that time that I had attended on behalf of
17 my boss to see what IBM's position should be in
18 the new era of opportunity in LCD technology.

19 In the course of doing all of
20 these things, I did research through this entire
21 time, in fact, I'm still doing plenty of
22 research. I think I was -- it's fair to say i
23 was recognized as a leader in integrated
24 semiconductor processing and equipment

1 technology, those things which helped one
2 realize what chemical and physical processes can
3 achieve in a technology, and for that I was
4 awarded a well-known prize by the American
5 Vacuum Society.

6 Q. Were those experiences in
7 semiconductor processing and equipment
8 technology relevant to the manufacturing of
9 liquid crystal displays?

10 A. Yes, certainly. In particular,
11 the wiring and the thin film transistors that
12 are built in liquid crystal displays are exactly
13 the same processes used in many of those other
14 technologies.

15 And furthermore, when you look at
16 the equipment industry that supplies those
17 expensive machines that go into those expensive
18 factories, they're the same companies basically
19 making ULSI claims, making LCD displays and the
20 like.

21 Q. After working at IBM, what did you
22 do?

23 A. I went to academia where I still
24 am. In particular, I went to North Carolina

1 State University. I had served on their
2 Industrial Advisory Board and knew the work very
3 well. They were at the time the leading center
4 for research and development in academia of the
5 kinds of technologies needed for semiconductor,
6 particularly silicon devices.

7 And it was an unusual situation
8 because this is a center sponsored by The
9 National Science Foundation, but in this
10 particular case together with an industry
11 consortium called the Semiconductor Research
12 Corporation.

13 After that I went to the
14 University of Maryland in 1996 where I have had
15 a number of positions beside my research in
16 teaching. I was director of another engineering
17 research center. I have a title. And five
18 years ago I was asked to start the Nano
19 Technology Center at Maryland, which I did. And
20 I learned last month that I have another
21 director's job to do.

22 Q. You're still a professor at the
23 University of Maryland today?

24 A. Yes.

1 Q. Well, in addition to work within
2 the universities, did you also have any
3 experience with industry?

4 A. Yes. I have enjoyed that from my
5 IBM days for sure. I have worked as a
6 consultant. I have had research support from a
7 number of companies. They are across the
8 spectrum of kinds of companies involved in this
9 area. And in particular I remember well in 1994
10 when the industry started its pre-competitive
11 technology roadmap working with that it's called
12 the SIA roadmap at the time, working with one of
13 those groups in metrology. And in particular I
14 remember leading the group on advanced process
15 control which has been a dominant theme in the
16 industry, now it's actually been accepted quite
17 well.

18 Q. And was much of that research
19 relevant to liquid crystal display manufacturing
20 technologies?

21 A. Oh, absolutely. One of the things
22 that's -- well, the LCD industry, the storage
23 industry, they all have these consortia for
24 pre-competitor research with the roadmaps and so

1 on, they use very similar processes in large
2 part, the same companies make the equipment to
3 do that, and so on.

4 In fact, that was the reason why
5 in 1994, actually, the same time, I started in
6 the professional society, the topical
7 conferences that led to the establishment of a
8 manufacturing and science technology focus
9 group.

10 Q. You mentioned earlier that you
11 were also involved in research. What type of
12 research were you involved in?

13 A. Well, that's changed over the
14 years. As I said, I started in fundamental
15 surface and solid state physics and interface
16 science. It migrated increasingly into
17 materials and process science and technology,
18 and that relationship of those processes to each
19 other and to the equipment that's needed to make
20 that happen. And I have enjoyed 25 or \$30
21 million of support from the National Science
22 Foundation, other government agencies in the
23 defense and intelligence industry, private
24 foundations and so on.

1 Q. Was any of this research relevant
2 to the manufacturing processes for liquid
3 crystal displays?

4 A. Yes. Certainly. For the parts
5 that create the TFT and wiring networks that are
6 found on LCD displays, it's very relevant.

7 Q. Have you previously been qualified
8 as an expert in a patent infringement
9 litigation?

10 A. Yes, I was. A couple of years ago
11 the case between LG and Chunghwa Picture Tubes
12 in California.

13 Q. What were the patents in that
14 case?

15 A. I was responsible to opine on the
16 '449 and the '737 patent.

17 Q. Are those patents directed to
18 manufacturing of liquid crystal displays?

19 A. Yes.

20 MR. GOODWYN: Your Honor, I would
21 like to offer Dr. Rubloff as an expert in the
22 field of semiconductor and thin film
23 manufacturing and processes including
24 manufacturing of thin film transistors for

1 liquid crystal displays.

2 THE COURT: All right.

3 MR. SHULMAN: No objection.

4 THE COURT: All right. He's
5 accepted.

6 BY MR. GOODWYN:

7 Q. Now, Dr. Rubloff, you mentioned at
8 the beginning of your testimony that you had
9 formed some opinions regarding the '629 patent.
10 What information did you consider in forming
11 those opinions?

12 A. Well, there were lots of
13 documents. Of course, the patent itself and its
14 file history. The discussions which accompanied
15 claim construction and the formation of joint
16 claim construction statements. The expert
17 reports, particularly of Dr. Silzars on
18 infringement and validity. The exhibits that
19 were included within those reports. A number of
20 prior art patents and publications. I also
21 considered as relating to the use of pattern
22 density and how one manages it when it becomes a
23 problem. I actually knew about that field and
24 already brought some of those articles to the

1 fore of my attention from the work I did in
2 advanced process control already.

3 I looked at many GDS files. These
4 are the mask files that describe the LG Display
5 products.

6 And I've considered deposition
7 transcripts, including In Duk Songs and Youngwoo
8 Cho. And of course I have listened to the
9 trial.

10 Q. What are your opinions with
11 respect to infringement and validity of the '629
12 patent?

13 A. Well, the first opinion I have is
14 that the accused products of LG Display do not
15 infringe Claim 7 and 16 of the '629 patent.

16 I say this on the basis of
17 understanding the structure which has been
18 discussed, if not debated here in the courtroom
19 called dummy patterns.

20 Dummy patterns are used in
21 manufacturing, in specific manufacturing process
22 as a way to deal with the complexity of the
23 structures that you have on the panel. And the
24 way chemical and physical processes come out

1 once you have these -- some structures in place
2 and attempt to build other ones. So I have been
3 able to consider that. And I have known about
4 that.

5 I know you've heard that the
6 accused wiring in this case, which Dr. Silzars
7 has talked about is what's called line on glass
8 wiring. And I have found having looked at all
9 of the accused structures in the mask files
10 associated with them, that this LOG wiring is
11 present in all of them, and they are certainly
12 not dummy patterns as described in the '629
13 patent.

14 Furthermore, I have tried to make
15 an analysis of the fractional area, the amount
16 of such dummy patterns if we were to make the
17 erroneous assumption that the line on glass
18 patterns are dummy patterns to see if they would
19 reach the thirty percent figure that's specified
20 in the patent and they do not.

21 Therefore, my conclusion, the
22 accused products do not infringe Claim 7 and 16
23 that have been asserted.

24 Q. And do you also have an opinion

1 with respect to whether the '629 patent is
2 valid?

3 A. Yes, I certainly do. I believe it
4 is invalid. First of all, the claims are
5 indefinite. I will hope to talk more about that
6 as we go along.

7 Secondly, the prior art discloses
8 all of the elements of the asserted claims. And
9 finally, on-sale bar, there were LG Display
10 products which if we assume the constructions
11 that have been offered by Dr. Silzars, those
12 products were sold more than a year before the
13 US filing of the '629 and, therefore, constitute
14 an on-sale bar invalidity.

15 Q. Let's first look at why you
16 believe Claim 7 and 16 are noninfringed. What
17 is your opinion regarding Claim 7?

18 A. So, Claim 7 is a dependent claim.
19 It depends on Claim 1, the independent claim
20 which is shown here, so this is a listing of the
21 elements of Claim 1. And I have looked at each
22 of these elements and what I find is two things;
23 one, is this first element, a layer of an
24 insulating substrate, having an area, is

1 indefinite. I would like to speak more about
2 that later.

3 And secondly, when we look at the
4 dummy conductive patterns statements that are in
5 the final element of Claim 1, the LG products
6 that have been -- have been accused, excuse me,
7 do not have dummy conductive patterns. And
8 structures which are there even if they were
9 dummy conductive patterns do not comprise thirty
10 percent of the area of the insulating substrate.
11 So because Claim 1 is not infringed, I conclude
12 Claim 7 cannot be infringed.

13 Q. Do you have a similar opinion with
14 respect to Claim 16?

15 A. Yes, I certainly do. Claim 16 is
16 again a dependent claim, and it's dependent on
17 Claim 9, the independent method claim that
18 corresponds essentially to Claim 1, the
19 independent claim of structure.

20 So I have marked again the two
21 elements, the forming a layer of insulating
22 substrate, having an area, as indefinite, and
23 then the last element about dummy conductive
24 patterns not being met by the LG products.

1 Q. When you say the dummy conductive
2 pattern element is not met by the LG products,
3 what are dummy conductive patterns in the
4 context of the '629 patent?

5 A. Dummy conductive patterns as I
6 said earlier are structures that are put into
7 the design of a product in order to aid a
8 manufacturing step.

9 And they have nothing to do with
10 the operation of the final product. They are
11 only to help get the manufacturing process to
12 work so that the product can work.

13 Now, both parties agree that dummy
14 conductive patterns do not convey electrical
15 signals during the operation of the display. So
16 in Trial Exhibit 1074 here, we have the claim
17 term dummy conductive patterns. LG's
18 construction is that portions of the layer that
19 do not receive or convey voltages or signals is
20 what a dummy conductive pattern is.

21 AUO's is somewhat more restrictive
22 than that, but it's essentially the same, a
23 metal pattern that does not conduct signals or
24 current used in the operation of the display.

1 So this is a little more
2 restrictive, but the important point here is
3 that both parties agree that if you have a dummy
4 conductive pattern, it cannot convey electrical
5 signals when the display is working.

6 And I note that this is also
7 supported by other things.

8 Q. What is your opinion regarding the
9 structure of LG Display's products that AUO has
10 accused of being dummy patterns?

11 A. They do not involve dummy
12 patterns. The structures which Dr. Silzars has
13 pointed to are line on glass structures which
14 you see here.

15 Let me take a minute to explain
16 this in some detail because I want to make sure
17 that we make contact with earlier discussion
18 yesterday and with the essence of what's here.

19 So what you see here is a picture
20 of -- it is an optical micrograph of an LG
21 product denoted as Trial Exhibit 903.

22 On the right side in the upper
23 portion, you see the gate pads which then fan
24 out to the gate lines in the TFT array that

1 makes the actual picture. As we move down on
2 the right side to the bottom, what we see is
3 wiring that goes from the pads on the product to
4 TCP, that's -- I have forgotten what that is.

5 Q. Was it tape carrier package?

6 A. Thank you, tape carrier package.
7 This piece of plastic which has wiring on it and
8 it goes to where there will be a chip.

9 Now, the wiring from that chip
10 also extends to the portion here which is toward
11 the center of the structure. And that wiring
12 goes to other pads on the substrate which are
13 shown near the middle of this structure. And
14 these are the pad connections to the line on
15 glass interchip wiring.

16 Q. Let me try putting on the
17 overhead, perhaps a little bit bigger picture,
18 that might help.

19 Are these photographs that were
20 included with your expert report?

21 A. Yes.

22 Q. I believe this is a portion that
23 you were just discussing up here in the top
24 left-hand corner. And it's continuing down.

1 What do you see continuing down?

2 A. So, these are the wiring to the
3 pads for the gate connections. They then go on
4 to the TCP, and to the chip that drives the gate
5 connections.

6 There are also a set of wires from
7 the chip which come up to -- in this picture --
8 the left side of the pads at the gate level and
9 then wires extend out from them and these are
10 the line on glass wires.

11 Q. Let me show one more photograph
12 that was included with your expert report that
13 shows a little bit bigger view.

14 What is shown now on this display?

15 A. Well, this is the entire chip that
16 is on the tape carrier package here. So
17 basically the idea is that there are things not
18 shown right in the middle that go to drive the
19 gate lines from the gate driving chip, but there
20 are also wires which come from the chip on to
21 the tape carrier package to additional pads next
22 to the gate pads and then to the line on glass
23 patterns of wiring that allow this chip to
24 communicate with the chip that's down further to

1 the left, not shown on this drawing.

2 Q. Is it your understanding that the
3 chip that's shown on the display is necessary
4 for the operation of the display?

5 A. It sure is. If you pull it off,
6 the display will go dark.

7 Q. Okay. There's a demonstrative to
8 your left that shows a printout of a mask file.
9 Can you show us on the demonstrative where these
10 photographs would correspond to?

11 A. Yes. They are upside down.
12 Please understand we have to think that way.

13 So what we have here, this is the
14 edge of the TFT display panel. These are the
15 pads that I alluded to on the left, center and
16 right.

17 The wiring, which I was talking
18 about, the line-on-glass wiring comes from a
19 side software that are in the circuit boards.
20 Wires turning the corner here. They then go out
21 through some of the pads with the line-on-glass
22 wiring to the TCP to a chip.

23 Here that chip now has the
24 information necessary to give the right signal

1 to the gate pads here that drive all of these
2 rows that are going to be on this display. And
3 the chip will send other information to the
4 line-on-glass patterns through an additional set
5 of pads here, that then go through the
6 line-on-glass wiring to the next chip.

7 Send the information through the
8 line-on-glass pads here to the next chip. The
9 next chip drives these lines that fan out here
10 like this, and sends the -- the information back
11 to -- back here onto the -- onto the panel to
12 more line-on-glass wiring that goes to the next
13 chip and so on.

14 This is a blow-up. In the middle
15 portion here showing the line-on-glass pads
16 here, that would connect, as I said, to the
17 chip. And then funnel that information down
18 these structures to pads that communicate with
19 the next chip.

20 MR. GOODWYN: Your Honor, may I
21 approach the witness?

22 THE COURT: You may.

23 BY MR. GOODWYN:

24 Q. Dr. Rubloff, I'm going to hand you

1 a panel from a LCD product manufactured by LG
2 Display, and I wonder if you could just very
3 briefly explain, using the panel, the
4 line-on-glass approach you just discussed?

5 A. Yes. So to keep it -- may I
6 stand? Is that okay?

7 THE COURT: Yes.

8 THE WITNESS: So to keep it in the
9 same orientation as you see here, the display
10 communicates with the outside world here through
11 printed circuit boards to give information to
12 the -- to the source lines here, which are
13 driven by the source driver chips here.

14 The technology advance that
15 happened here, wouldn't it be nice if I didn't
16 have this? Well, we used to have that up here.

17 Now, what we have is just these
18 little tape.

19 Carrier packages with chips on
20 them here. And they get the information, not by
21 this rudimentary way of doing it, but by having
22 signals, line-on-glass signals that go through
23 the glass here, go over to the corner, turn the
24 corner here, then go on to take care of your

1 package. Excuse me if I use some more
2 interesting language.

3 Talk to the chip. Tell the chip
4 here what signals to send out to the gate lines
5 in this region.

6 Then those -- that information,
7 and power and other things are communicated back
8 onto the glass, the line-on-glass wiring. Then
9 out here to the next chip, back over and so on.

10 Q. Dr. Rubloff, did you review LG
11 Display's mask files -- I'll take this from you.

12 Did you review LG Display's mask
13 files to determine whether or not all of the
14 accused products use this line-on-glass
15 technology?

16 A. Yes. I looked at every one of the
17 -- at the mask files for every one of the
18 accused products.

19 Q. And are the -- put up on the board
20 -- I'd ask you to look at your binder that you
21 have with you. There's a tab with 46 numbered
22 tabs.

23 If you could look at the first
24 one, and the first page of the first one.

1 A. Yes.

2 Q. There's a printout from a mask
3 file. Is this the printout from the mask file
4 in your notebook?

5 A. Yes.

6 Q. Okay. Now, how do you know that
7 this uses line-on-glass technology?

8 A. Well, right here what we see are
9 gate pads that go to the fan out for the gate
10 structures. And next to it we see a number of
11 pads here that would then be communicating
12 through the tape carrier package to a chip.

13 And it shows a number of
14 structures here. And if I follow on the mask
15 file, these structures, for example, this heavy
16 one here that goes this way or this one here
17 that goes this way, these guys go a long
18 distance to the left, and then come back in a
19 fairly symmetrical pattern to what we see here
20 near the location of the next chip.

21 Q. Now, if we zoom in on one of those
22 pictures, which I believe is probably the third
23 picture in your binder, you see some text, VOG,
24 VVV, GOE.

1 Did you add those labels?

2 A. No. The mask file, the GDS file
3 that gives a complete design of this structure
4 has the different, for example, the red layer,
5 for gate metal, the different layers of material
6 that are patterned on this structure, but it
7 also includes layers that are really there to
8 annotate the design.

9 And so this layer is a separate
10 layer in the mask file that you can turn on and
11 off in various kinds of viewers we have for
12 dealing with GDS software. And so this is
13 simply there because I turned on that layer, so
14 it would print.

15 Incidentally, these displays are
16 so complicated, the designers need these kinds
17 of annotations to keep track of where they are.

18 Q. Okay. Just before those numbered
19 tabs, there's a list that's three pages long
20 that identifies each of the mask files
21 associated with the 46 tabs.

22 Does this document reflect the
23 names of the mask files that you reviewed with
24 respect to your noninfringement analysis of the

1 '629 patent?

2 A. Yes. I didn't memorize all 46,
3 but they look just about right.

4 MR. GOODWYN: Your Honor, I'd like
5 to move into evidence the list of mask files
6 that Dr. Rubloff reviewed, and it's from LGD
7 Trial Exhibit 380.

8 MR. SHULMAN: No objection.

9 THE COURT: It's admitted.

10 BY MR. GOODWYN:

11 Q. Now, Dr. Silzars -- first, you
12 said you were present in the courtroom when
13 Dr. Silzars testified; is that right?

14 A. Yes, I was.

15 Q. Now, Dr. Silzars had testified
16 about line-on-glass being necessary for etching
17 and to protect those outermost lines in the fan
18 out. Do you agree?

19 A. No, I do not agree.

20 Q. Why?

21 A. Actually, in my deposition
22 testimony, I talked about the pattern dependency
23 that sometimes is an issue for
24 manufacturability. And one of the things that I

1 said was that these pattern dependencies are
2 known.

3 We try -- when we're developing a
4 product or a technology, we try to first develop
5 the rudiments of that so that we can make some
6 devices working, and so that we know what are
7 the next set of problems to address.

8 Because by the time you get to a
9 product this complex, there may be many such
10 challenges. So we don't -- we know that pattern
11 dependency can happen.

12 But we only address it when we
13 start to see where there's evidence for it. And
14 there is no evidence that's been presented nor
15 that I have seen of a pattern dependency in any
16 of these LOG structures. In fact, there's
17 evidence to the contrary.

18 Q. What evidence to the contrary are
19 you discussing?

20 A. Well, one thing is the testimony
21 of In Duk Song from LG who said they had
22 analyzed this. They had never seen a problem
23 that is that one described in the specification
24 of the '629 patent.

1 The second is that yesterday we
2 saw a mask file where those LOG structures were
3 not present during the time of etching. So
4 that's a very nice experiment to test whether
5 there is a problem such as that highlighted in
6 the specification of the '629.

7 Q. Is the mask file you just
8 mentioned on the display now that's been marked
9 as LG Display Trial Exhibit 1080?

10 A. Yes, it is.

11 Q. How do you know there aren't any
12 patterns present during the etching of the fan
13 outs of the gate metal?

14 A. From a number of things. First of
15 all, I note we saw this zoomed up yesterday.

16 But the gate layer is the red
17 layer here. I happen to remember what they are
18 and I know these colors by now.

19 The blue is a silicon layer. The
20 source drain layer is the kind of pink-purple
21 layer and so on.

22 And so when this structure was
23 made, the blue layer was not present. These are
24 little blue dots actually.

1 And they were not present when the
2 etching of the gate metal layer, which is in red
3 was actually done. So here's the case where
4 there was no metal in the region where the
5 line-on-glass wiring of gate metal is present in
6 the accused LG products.

7 Q. Would this figure that's now on
8 display, which just shows the gate metal layer,
9 show the structures that would be present during
10 the etching of the gate metal layer?

11 A. Absolutely.

12 MR. SHULMAN: Could we just
13 identify what it is we're looking at?

14 MR. GOODWYN: Sure.

15 MR. SHULMAN: The record is going
16 to be a mess.

17 MR. GOODWYN: I identified it as
18 LG Display Trial Exhibit 1080.

19 MR. SHULMAN: Production numbers.

20 MR. GOODWYN: They're printouts
21 from a mask file, which I think I read out
22 yesterday, which is NBPC_P2_10.41 -- or excuse
23 me, 10.4_ SVGA_G005.gds.

24 MR. SHULMAN: Thank you.

Q. Now, I apologize, Dr. Rubloff.
Did I interrupt your testimony?

A. Well, let's see. I think your
question was you said that this is a printout,
which shows only the gate layer. And so you can
see that there is -- there are pads here that
could have been used in this product for
line-on-glass wiring, but there is no such here.

We don't see these structures
that -- if I may now refer to this big poster
here. We don't see these structures, those
accused by Dr. Silzars in the product. Yet this
product has been sold successfully, I
understand. And I think that's a very good
evidence that there was no problem here --

Q. Okay.

A. -- with the etching described in
the specification.

Q. Well, in addition to the fact
that, in your opinion, LG Display's products
don't have dummy conductive patterns, you also

1 mentioned that they don't meet the limitation
2 related to the 30 percent of an area.

3 What is your understanding of the
4 meaning of that in the claim in the context of
5 the '629 patent?

6 A. So I made a slide for that. Thank
7 you.

8 So what's important in
9 interpreting the last element of Claim 1, and I
10 guess it was Claim 9 is to understand how would
11 we interpret area to evaluate a 30 percent
12 limitation. Thirty percent is always enumerator
13 over a denominator.

14 Now, the claim term that we start
15 with is a layer of insulating substrates having
16 an area. My belief is that this is indefinite
17 because there are many layers on these
18 substrates. And there's another part of the
19 claim which says forming a layer, and we know
20 this technology is all -- all about forming a
21 layer.

22 And once we have these layers,
23 they have different pieces to them. So there
24 could be many different areas.

1 So that's the basis on which I
2 think this is indefinite. I do believe that the
3 best interpretation and construction for this
4 claim term, and I want to adopt some term --
5 some construction in order to make an analysis
6 of infringement, is that offered by LG Display,
7 which is material deposited and patterned on
8 substrate, such as glass, that covers part of
9 the array substrate surface.

10 We didn't get any help from AUO on
11 what this claim term means. I guess that means
12 that they don't agree it's indefinite.

13 The word area is certainly
14 indefinite, and so I've interpreted it in this
15 way. I would have to say that AUO's
16 construction didn't help me either by giving
17 just a synonym.

18 Q. Okay. Well, did you prepare a
19 demonstrative that helps you to explain what
20 that construction means?

21 A. Yes. I hope it's the next slide.

22 Yes. Thank you.

23 So Claim 1 talks about a layer of
24 an insulating substrate, having an area. And

1 Claim 9 is about forming it.

2 So we start with the glass
3 substrate. That's what all these technologies
4 begin with.

5 Then we deposit the gate metal
6 layer or the first layer on the substrate which
7 would be patterned. And then next we pattern
8 that structure to form pads for bringing signals
9 into the gate lines and then fan outs of those
10 signals to the gate lines that stretch across
11 the substrate.

12 And so this area that we see from
13 the left where you see they're kind of really
14 larger things to the right and all the way
15 across the panel is where the picture would
16 appear on the display that we're looking at.

17 The dummy patterns in the '629
18 patent are specified to be situated between the
19 connection pads, which are these dark -- two
20 dark things at the left hand of this picture and
21 the pixel electrodes, which is everything in the
22 picture part of the display.

23 And so I've colored in yellow the
24 region where the dummy patterns would have to

1 exist. I should note that I've gone a little
2 too much towards the front with the element. It
3 should go from the foremost gate line to the
4 rearmost gate line.

5 Q. Okay. Now, what is your opinion
6 regarding AUO's infringement claims related to
7 the claim limitation dummy conductive patterns
8 comprising about 30 percent of the area?

9 A. Well, I'm sorry. If you'll just
10 leave that -- if you'll leave that up then.

11 Q. Okay.

12 A. If there were to be dummy
13 conductive patterns, they have to be in the
14 region specified by yellow. And so in
15 evaluating the percentage, I will take the area
16 of the dummy conductive patterns and divide by
17 the area of the entire layer, because I think
18 that's the appropriate way to look at the
19 definitions that are here, and the final element
20 of Claim 1.

21 Q. When you say total layer, are you
22 referring to the total layer on the substrate or
23 the total layer occupied by the metal?

24 A. Just by the metal. There's an

1 important physical reason for thinking this way.

2 We build the gate line structures
3 by the thousand or so to be able to run this
4 display, and the dummy patterns would be there
5 to improve manufacturability, if needed, of
6 those gate line patterns.

7 So a measure of how much has been
8 needed from dummy patterns is to relate what's
9 been added to the things which need to be there
10 already.

11 Q. Okay. Now, with respect to the
12 specific 30-percent limitation, did you form an
13 opinion?

14 A. Yes. Under this algorithm for
15 figuring out what the percent would be, the LOG
16 wiring in the products is certainly less than 30
17 percent of the gate metal layer.

18 Q. And what if you were to interpret
19 it differently?

20 A. Well, I thought of other kinds of
21 interpretations because of the indefiniteness
22 problems with this pattern. And another one I
23 thought about is, well, suppose the LOG wiring
24 were to be dummy patterns.

1 I'm sorry. That's the assumption
2 in both of these cases. If we were to assume
3 the LOG wiring were a dummy pattern, which it's
4 not, what fraction would it comprise of the
5 portion which was essentially the yellow part?

6 And I did that calculation. So if
7 the LOG wiring here were a dummy pattern, what
8 fraction of the yellow area, essentially would
9 that be? And that's under that.

10 Q. Can you turn and point to the
11 demonstrative of the full mask file of one of
12 the accused LG Display's products of the area
13 you considered?

14 A. So, yes. So the gate pads are
15 this region, this region and this region.

16 The fan out of those -- to the
17 lines comprising -- this is kind of -- I hope we
18 can see triangular region, triangular region,
19 triangular region.

20 And the portion that the line on
21 glass wiring going from this end to here and
22 then from here to here and from here to here is
23 shaped like this, the portion of that. That
24 starts at the -- at -- the end of the pads

1 closest to the TFT array would be included in
2 that configuration.

3 Q. Now, in addition to forming an
4 opinion with respect to noninfringement, did you
5 also form an opinion with respect to the
6 validity of the '629 patent?

7 A. Yes, I did.

8 Q. In addition to your invalidity
9 discussions that you've just had, did you also
10 review prior art?

11 A. Yes, I did.

12 Q. Did you review a reference that
13 I'll refer to as the Hirabayashi '695 or EP
14 '695?

15 A. Yes.

16 Q. Is this that reference?

17 A. That's the reference.

18 Q. Did you form an opinion as to
19 whether or not EP '695 anticipates the asserted
20 claims?

21 A. Yes, I did the evaluation this
22 way. I looked at each and every claim in the
23 '629 patent, which was asserted.

24 And I looked at the reference that

1 you see here, the '695 and asked if each and
2 every claim element in the asserted claims could
3 be found in this patent. And the answer was
4 yes.

5 Therefore, this patent, by itself,
6 anticipates the '629 patent.

7 Q. Can you show us where in the EP
8 '695 patent each of the limitations are
9 disclosed?

10 A. Sure. So I'd like to start with
11 the independent Claim 1, which I believe --
12 which I've reproduced here. And there are some
13 pictures and references that I've put on the
14 right-hand side of this slide.

15 So the preamble is an array
16 substrate for display, of course. And then the
17 first three elements of that claim, a layer of
18 an insulating substrate, a -- having an area.

19 A thin film transistor array on
20 top of it and plurality of wiring. I'm sorry.
21 Just the first two of those are found in EP '695
22 Column 31, Lines 16 to 23.

23 Then a plurality of wiring, in the
24 next element, arranged on the insulating

1 substrate, that can be found in Figure 4 of the
2 EP '695 patent as I've shown here, these are the
3 various pads and pixel regions and so on.

4 The next element of the claim,
5 connection pads, can be found in -- along with
6 pixel electrodes in Figure 1, and designated by
7 the yellow highlighted pieces, the numbers of
8 which I'm sorry, I cannot read. But they are
9 there, and I have looked at them a number of
10 times, including last night.

11 And finally, the dummy conductive
12 patterns element is here. The last one of Claim
13 1. And the evidence for that in the EP '695 is
14 found in column 19 lines 49 to 54.

15 Q. This is Claim 1. Did you also
16 find sufficient disclosure with respect to
17 asserted Claim 7?

18 A. Yes, I did.

19 Q. And can you explain to us how all
20 the limitations of Claim 7 are disclosed in EP
21 '695?

22 A. Well, I just talked about Claim 1,
23 and now let's talk about what's needed to get to
24 Claim 7. Claim 7 is dependent on Claim 4 which

1 is dependent on Claim 2 which is dependent on
2 Claim 1.

3 So Claim 2 talks about a dual
4 metal structure, and Claim 4 talks about the
5 selection of the upper layer of wiring from the
6 molybdenum and a number of other refractory
7 metals, and the evidence from that comes from EP
8 '695 column 16, lines 19 to 28.

9 And then the Claim 7 talks about
10 the upper layer wiring material not becoming
11 insoluble in an acid or alkaline etchant, and I
12 tell you that titanium nitrate does not become
13 insoluble in an acid or alkaline etchant.

14 Therefore, all of the elements of
15 Claim 7, 4, 2 and 1 are found in EP '695, and,
16 therefore, this claim is invalid as anticipated.

17 Q. Did you do a similar review for
18 asserted Claim 16?

19 A. Yes, I did.

20 Q. Can you briefly explain that to
21 us?

22 A. Yes, I'll make it very brief.
23 It's essentially the same argument. This is the
24 method claim and there is one extra element in

1 the sequence of dependent claims needed to get
2 to 16, and that is Claim 11 which is the group
3 of aluminum and aluminum alloys, and that's also
4 found in exactly the same reference, column 16,
5 lines 19 to 28.

6 Q. In addition to the EP '695, did
7 you also review a reference, Watanabe 275?

8 A. Yes.

9 Q. Is this the reference shown on the
10 display now?

11 A. Yes.

12 Q. Did you form an opinion as to
13 whether this reference anticipates or renders
14 obvious the claims of the '629 patent?

15 A. Yes, I believe that Watanabe 275,
16 this reference, together with other references
17 would render the '629 patent invalid for
18 obviousness reasons.

19 Q. Can you step us through your
20 analysis, please?

21 A. Yes. So let's start with Claim 1
22 again. We're a little lucky here that the
23 reference in the '275 patent, column three,
24 lines 37 to 49 has essentially all of the

1 components, all of the elements of Claim 1.

2 Q. What about the dependent claims?

3 A. Of the dependent claims, including
4 Claim 2, which requires a dual layer metal
5 structure that is missing from Watanabe 275, and
6 if one were to have that, one would likely have
7 also Claims 4 and 7, but let me go through that.

8 '275 does not disclose a double
9 layer gate metal wiring. But the '275 patent
10 does mention the metals that might be used, as
11 molybdenum, aluminum, chrome and so on, so it
12 gives us a hint where we might go.

13 The '430 patent, which is another
14 prior art patent, discloses a two-layer
15 structure of molybdenum, that's column four, 39
16 through 55 in Exhibit 315.

17 The '629 patent --

18 Q. Before you go on, the '430 patent,
19 can I have that up there, please. Is what's
20 shown on the board the '430 patent, the patent
21 that you're referring to?

22 A. Yes, that's Kubota.

23 Q. Kubota?

24 A. Yes, that's it.

1 Q. And that's identified as LG
2 Display Trial Exhibit 315.

3 A. Okay. Continuing on, the '629
4 patent admits that the dual layer structure was
5 known in the art, so there would be other
6 references for that as well.

7 Therefore, it would have been
8 obvious to form a dual layer wiring as described
9 in the '430 and the '629. And so the dual layer
10 with molybdenum on top will inherently not
11 become insoluble in acid or alkaline solution.

12 So if we take Watanabe 275
13 together with other references, I would judge
14 that Claim 7 is obvious and therefore invalid.

15 Q. I believe you indicated earlier
16 that all of the elements of Claim 1 are
17 disclosed in Watanabe; is that correct?

18 A. Yes.

19 Q. And the one thing that's missing
20 is the double layer gate metal wire layer?

21 A. Yes.

22 Q. '629 and Kubota both disclose a
23 double wiring structure?

24 A. Yes, that's true.

1 Q. Did you also do a similar analysis
2 with respect to Claim 16?

3 A. Yes. So Claim 16 is a dependent
4 claim, depending on the method Claim 9. And
5 exactly the same reference that was '275 patent
6 column three, lines 37 to 49, has all of the
7 elements of Claim 9 in it.

8 Q. Okay. And the dependent claims?

9 A. And the dependent claims work
10 essentially the same way. As I mentioned, there
11 is one little difference which is aluminum which
12 is Claim 11, but that's also found in these
13 references.

14 Q. Now, you also mentioned an on sale
15 bar, and in your expert report, you had
16 identified a couple of products manufactured by
17 LG Display, the LT060V1 and the LT071V1. Do you
18 have an opinion as to whether or not the
19 products manufactured by LG Display, those
20 products would anticipate or render the claims
21 invalid or an on sale bar?

22 A. Yes, they would.

23 Q. Did you look at those mask files?

24 A. Yes.

1 Q. For the record I would like to
2 show you a portion of a mask file printout from
3 a mask file C7160VA01.GDS with a cell
4 60LAY_PNL_\$49, is what's shown on the display
5
6
7
8
9

10
11 MR. SHULMAN: Could we have a
12 copy.

13 MR. BONO: Your Honor, would you
14 like a copy of the binder for these exhibits?

15 THE COURT: You can pass it to the
16 clerk.

17 BY MR. GOODWYN:

18 Q. I think my question was,
19 Dr. Rubloff, do you see a difference between
20 this mask file and the one you saw earlier with
21 respect to the dots?

22 A. Yes. You'll note that the dots
23 are a different color, they are red in this
24 case. And what that tells us is that those dots

1 were patterned into the gate metal layer when
2 the gate lines are made as well.

3 Q. So if we look at just the gate
4 layer, which is another -- it's just only layer
5 six from the same printout; is that right?

6 A. Yes. So you see the dots here,
7 you see the gate fan out region here to go to
8 the gate lines and so on.

9 Q. And in accordance with the
10 testimony that Dr. Silzars had, would those be
11 dummy conductive patterns?

12 A. Yes, under his interpretation and
13 construction, these would be dummy patterns.
14 Notice that they exist between the inner edge of
15 the gate pads and the TFT display. They are not
16 connected to any wiring. And so they would
17 function as dummy pads.

18 He also made comments about
19 regular structures which is exactly what you see
20 here that could be divided in any number of
21 ways. So there could be -- he would potentially
22 give many different ways of drawing the dummy
23 structures here.

24 Q. Well, do you know what material

1 was used in forming the gate lines for this
2 product?

3 A. Yes. That's the dual layer,
4 aluminum neodymium on the bottom, molybdenum on
5 the top.

6 Q. What is the basis for that
7 understanding?

8 A. That's been testified by an LG
9 engineer, Youngwoo --

10 Q. In Duk Song?

11 A. He may have said it, but there was
12 another one.

13 Q. Youngwoo Cho?

14 A. Thank you.

15 Q. And do you have an understanding
16 of when this product was made and sold in the
17 US?

18 A. Yes, I do.

19 Q. What's the basis -- first of all,
20 what is that understanding?

21 A. The understanding is that this
22 product was sold in the 1999-2000 time frame
23 into the United States.

24 Q. At what point in time? I'm sorry,

1 you said '99. What was the basis for your time
2 frame?

3 A. Oh, yes. I had a discussion with
4 In Duk Song in Korea to make sure I understood
5 the time frame for the sales of these, and I had
6 another discussion with an LG representative who
7 was here, who I think you will hear from later.
8 He showed me the sales data and the invoice data
9 for these products, and they were in the time
10 frame well before the sale bar.

11 Q. Is there any information in the
12 mask file itself that would give you an
13 indication of the date of the mask file?

14 A. Yes. These mask files as I said
15 have a number of different kind of annotations
16 and, of course, one of them is a time stamp or a
17 date stamp. So in the program which I used to
18 analyze the GDS file, there is tools, and then
19 you pick time stamp and you see what the date of
20 that is. And it says 1998.

21 Q. 1998.

22 Well, I would like to show you a
23 mask file for the other product that you
24 mentioned in your expert report. And it comes

1 from the same mask file, C7160VA01.GDS, but has

2
3
4
5
6
7
8 A. I actually don't remember if
9 that's the difference, but maybe.

10 Q. Okay.

11 MR. GOODWYN: Your Honor, I would
12 like to move in evidence the printouts from the
13 mask files for the products LT060V1 and LT071V1
14 that come from the file C7160VA01.GDS, and are a
15 part of LG Display Trial Exhibit 380.

16
17
18
19
20
21 Shown in the mask files that we
22 just went through if you apply Dr. Silzars'
23 definition.

24 A. Absolutely.

1 Q. Would the same be the case for
2 Claim 16?

3 A. Yes.

4 Q. Dr. Rubloff, if I could just ask
5 you to very briefly summarize your opinions with
6 respect to the '629 patent?

7 A. My opinion is that the accused
8 products do not infringe any claim of the '629
9 patent. And that the '629 patent is invalid for
10 three reasons; it's indefinite, it's invalid
11 over prior art, and because of on-sale bar.

12 MR. GOODWYN: Thank you,
13 Dr. Rubloff. No more questions, Your Honor.

14 THE COURT: All right. We'll
15 recess for lunch for forty-five minutes. We'll
16 come back at about 1:35.

17 (A luncheon recess was taken.)

18 THE COURT: All right. Be seated,
19 please.

20 MR. CHRISTENSON: Your Honor,
21 before we proceed with Dr. Rubloff's testimony,
22 I just wanted to respectfully request that some
23 of the exhibits that were offered in during
24 Dr. Putnam's testimony be submitted under seal

1 because they contain confidential information of
2 third parties and pursuant to your rulings
3 yesterday, my understanding is to protect the
4 interest of those parties, you would allow us
5 those materials to be submitted under seal,
6 specifically this would be the license
7 agreements and patent agreements that are
8 summarized in AUO Exhibit 1563, and there was
9 also I think it was Exhibit 273 which was Putnam
10 Exhibit 13 to his report. All of those
11 documents contain highly sensitive confidential
12 third-party information and we respectfully ask
13 that they be admitted under seal.

14 MR. TYLER: No objection, Your
15 Honor.

16 THE COURT: They'll be submitted
17 under seal without objection.

18 MR. GOODWYN: Your Honor, one more
19 quick housekeeping matter. With respect to the
20 documents that Dr. Rubloff referred to during
21 his direct examination, there is an LGD Trial
22 Exhibit 1082, and I would like to move or offer
23 into evidence the exhibit and all the documents
24 identified there.

1 MR. SHULMAN: We'll have to look
2 at it, but --

3 THE COURT: We'll admit it subject
4 to any objection you may have.

5 MR. SHULMAN: Very well.

6 THE COURT: Ready to proceed?

7 MR. SHULMAN: Yes.

8 CROSS-EXAMINATION.

9 BY MR. SHULMAN:

10 Q. Dr. Rubloff, you and I have not
11 met before; correct?

12 A. I think that's right.

13 Q. Okay. My name is Ron Shulman and
14 I have some questions for you regarding the '629
15 patent.

16 Now, you understand, sir, that at
17 this trial, AUO is asserting Claims 7 and 16 of
18 that patent against LG; correct?

19 A. Yes.

20 Q. Okay. And Claim 7 and 16 are
21 dependent claims; correct?

22 A. Yes.

23 Q. Okay. And Claim 7 depends
24 indirectly from independent Claim 1 and 16 does

1 likewise from Claim 9; correct?

2 A. Yes.

3 Q. Now, let's look at independent
4 Claim 1 on the screen. You agree that Claim 1
5 is directed to "an array substrate for display"?

6 A. Yes, that's what it says.

7 Q. And the first element of Claim 1,
8 that first subparagraph calls for a layer of an
9 insulating substrate having an area, do you see
10 that?

11 A. Yes, I see that.

12 Q. And the insulating substrate
13 refers to a piece of suitable insulating
14 material such as glass, for example; correct?

15 A. Okay.

16 Q. Is that right?

17 A. The insulating substrate, yes.

18 Q. Okay. And that insulating
19 material such as a piece of glass is said to
20 have, "an area," according to the claim;
21 correct?

22 A. That's what it says.

23 Q. And Claim 9 says the same thing;
24 right?

1 A. Yeah, forming that.

2 Q. And in your personal opinion, the
3 meaning of the term, "an area," as recited in
4 Claims 1 and 9, is, "insolubly ambiguous";
5 correct?

6 A. That's right.

7 Q. Okay. Now, let's look at the
8 third element of Claim 1. And this element
9 calls for a plurality of wiring arranged on the
10 insulating substrate with each wiring having a
11 first end, et cetera, et cetera. Correct?

12 A. Yes, that's what it says.

13 Q. Okay. And once again, in your
14 personal opinion, the meaning of the term "each
15 wiring", as recited in Claim 1, also is,
16 "insolubly ambiguous"; correct?

17 A. I think that's what I said in the
18 report.

19 Q. Well, let me remind you. Could we
20 have his invalidity report, Section G on page
21 77, please.

22 And you stated here on page 77 of
23 your invalidity report that specifically, "It is
24 my opinion that the terms 'area', 'each wiring',

1 and 'the dummy patterns' comprising at least
2 about 30 percent of the area of the insulating
3 substrate, as recited in Claims 1 and 9 are
4 insolubly ambiguous."

5 That was your opinion; right?

6 A. Yes. What I meant by that was
7 that there was no clear distinction on the
8 proper interpretation of those terms. And
9 that's the reason why I spent significant effort
10 trying to imagine what is the most reasonable
11 definition of those terms --

12 Q. Okay. But you --

13 A. -- in order to understand the
14 patent.

15 Q. Your personal opinion was that
16 they're insolubly ambiguous; right?

17 A. Correct. What I meant --

18 Q. I'm going to get to what you meant
19 in a moment. What you said in your report is
20 these terms are quite insolubly ambiguous;
21 right?

22 A. That's what I said.

23 Q. Okay. Now, the adverb insolubly
24 means incapable of being explained; correct?

1 A. Where does that come from?

2 Q. Well, let's pull up a dictionary.
3 Can we have the dictionary definition of
4 insoluble?

5 It has two definitions. One of
6 which has to do with dissolving salt in water
7 and that's not applicable here; right?

8 A. Right.

9 Q. Okay. And the second definition
10 is incapable of being solved or explained.
11 That's what insolubly means in this context;
12 correct?

13 A. Well, that's what the dictionary
14 says.

15 Q. Well, you speak English; right?

16 A. Certainly do.

17 Q. And you were using insolubly as
18 people who speak English use the word insolubly?

19 A. I used insolubly to mean that
20 is -- cannot be done ambiguously. And I did not
21 look in the dictionary to look up that term.

22 I used it in the sense that I
23 normally would have in dealing with an issue
24 where there is ambiguity.

1 Q. Okay. And what you said is
2 insoluble. Insoluble, the amplifier is such
3 that it can't be such?

4 A. You're reading it with my use of
5 the word what you think I meant by the word.

6 Q. Well --

7 A. I'm telling you what I mean.

8 Q. Okay. So you use the word in a
9 way that the dictionary doesn't define; is that
10 your testimony?

11 A. I'm sorry. The dictionary doesn't
12 have all the nuances of context or use of words,
13 and I certainly don't look up every word in the
14 dictionary before I use it.

15 Q. Okay. But you do use it?

16 A. I'm sure other people don't
17 either.

18 Q. Could you explain to the Court
19 exactly what you meant by insoluble?

20 A. What I meant by insoluble was that
21 there is ambiguity in the terms that I use this
22 expression for. And despite my efforts and
23 discussions with whoever I might choose to
24 discuss this with and whatever references I

1 might take, I will never have a strong degree of
2 confidence. No. That is uniquely the right
3 explanation for those terms that I labeled as
4 indefinite.

5 Q. Okay. So, in your opinion, there
6 is no definite meaning of these terms; correct?

7 A. The terms are indefinite.

8 Q. Okay.

9 A. Yes.

10 Q. And if you don't definitely know
11 what these terms mean, then would you agree that
12 you're also incapable of telling this Court
13 whether these terms that have no meaning to you
14 exist in the accused products and in the prior
15 art?

16 A. Absolutely not.

17 Q. Okay. Let's move on.

18 Is it correct, sir, that as
19 explained in the '629 patent, the problem the
20 patent addresses is known as undercutting that
21 can occur during the wet etching process?

22 A. Well, that's part of the
23 description. It's really talking about the use
24 of wet etching as you etch through a layer,

1 reach another layer at which two different
2 mounts or different work functions create what's
3 sometimes called a battery effect that can cause
4 a change in the etching characteristics.

5 Q. So what I said is not correct?

6 MR. GOODWYN: Objection. Your
7 Honor, if counsel would allow the witness to
8 complete his answer.

9 MR. SHULMAN: I'm sorry. I
10 thought he was done.

11 THE WITNESS: I'm sorry. The last
12 -- where was I?

13 BY MR. SHULMAN:

14 Q. I'll just ask the question again.
15 Is it correct that your opinion, sir, as
16 explained in the '629 patent, the problem that
17 the patent addresses is known as undercutting
18 that can occur during the wet etching process?

19 A. Undercutting is a part of the
20 phenomenon described in the specification. It
21 is not described in the claims.

22 Q. Okay.

23 A. The claims are very broad in this
24 patent. The motivation is to look at issues of

1 etching in dual layer structures and
2 undercutting and the relationship to specific
3 structures in the vicinity. That is the focus
4 of much of the discussions in the specification.

5 Q. Very good. Let's look at your
6 opening report at Page 16, please.

7 You did write that, "As explained
8 in the '629 patent, Column 2, Lines 56 to 63,
9 the problem addressed is the development of an
10 undercut." You did say that; right?

11 A. As I see it, that's not the end of
12 the sentence.

13 Q. We're getting to the next part.
14 But you did say that; right?

15 Yes?

16 A. Yes.

17 Q. Okay. And the undercutting refers
18 to the fact that during the wet etching process
19 of double layer wiring structures, the lower
20 layer of metal is etched underneath the top
21 layer of metal; correct?

22 A. Well, are you quoting the next
23 sentence?

24 Q. Just tell me whether it's correct

1 and then we'll look at the rest of the sentence?

2 A. That's a part of it.

3 Q. Okay. Let's look at the rest of
4 the sentence.

5 As explained in the '629 patent,
6 the problem addressed is development of an
7 undercut or where the aluminum surface is etched
8 underneath the top metal. That's true; right?

9 A. Yes.

10 Q. Okay. And undercutting of double
11 layer wires during wet etching is a problem,
12 because it can reduce manufacturing yield by
13 causing electrical shorts; true?

14 A. Electrical shorts. May be other
15 things as well.

16 Q. Okay. Now, according to the '629
17 patent, this undercutting problem can occur due
18 to a phenomenon known as passivity of the top
19 layer of the metal wire; correct?

20 A. I think that's what it says.

21 Q. And passivity means that the top
22 layer of metal becomes insoluble in the acid or
23 alkaline solution used as the etchant; correct?

24 A. Reduced etching.

1 Q. Pardon?

2 A. Reduced etching, right.

3 Q. Okay. So, well let's look at what
4 the patent says. '629, Column 5, 13 to 17.

5 In the present invention, the term
6 passivity is referred to as a phenomenon that
7 metal such as molybdenum or a metal alloy such
8 as a -- the M word alloy becomes insoluble in an
9 acid or alkaline etchant. That's what the
10 patent says; right?

11 A. Mm-hmm.

12 Q. And when the top layer of metal
13 becomes insoluble in the etchant, but the bottom
14 layer does not, you can get this etching
15 underneath that is referred to as the
16 undercutting problem; correct?

17 A. Yes, that's -- that's the
18 mechanism by which you would worry about the
19 shape, the mouse hole, the overhang and so on.

20 Q. Right. Now, is it true, sir, that
21 there are many different metals that can be used
22 to form the top layer of a wire to be etched?

23 A. I think there are a number. Sure.

24 Q. Yeah. And some examples are given

1 in the patent, for example; right?

2 A. Okay.

3 Q. And let's look at Column 4 and 5
4 of the patent. In there, they -- the inventors
5 identify molybdenum, chromium, tantalum,
6 titanium, and other alloys are some of the
7 suitable metals that can be used for the top
8 layer of the wire; right?

9 A. Yes.

10 Q. And is it true, sir, that there
11 are many different or several different wet
12 etchants that can be used to etch both the top
13 and bottom metal layers of the wire?

14 A. Yes, with different results
15 possibly.

16 Q. Right. And according to the '629
17 patent, these different wet etchants would
18 include both acidic solutions as well as
19 alkaline solutions; right?

20 A. You know where that reference is?

21 Q. Yeah. Let's look at the -- on the
22 screen '629, Column 5, Lines 13 to 17. You see
23 that it says you can use either acid or an
24 alkaline etchant; right?

1 A. Well, this is talking about what
2 causes passivity, not what acid or alkaline you
3 can use to do the etching.

4 Q. Well, it's talking about the
5 insolubility of a metal in the etchant and it
6 says the etchant can either be acidic or
7 alkaline; right?

8 A. Right. I thought your question
9 had to do with whether you can use acids or
10 alkalines to do etching at various points in the
11 patent.

12 Q. Right. It says the etchant that
13 leads to the solubility problem, sometimes is an
14 acid or sometimes is an alkaline; right?

15 A. Well, this is not really
16 prescribing what the etchant is.

17 Q. Okay. Well, let's move on. It's
18 not important.

19 A. This is making the assumption that
20 there's an acid or an alkaline that's used to do
21 etching. And in some cases, there may be a
22 passivation that develops during that process.

23 Q. Okay. And the inventors provided
24 you some examples of different kinds of acidic

1 etchants that can be used in the patent; right?

2 A. I think that's right, but you
3 probably can put it on the screen for me.

4 Q. Sure. Columns 6, Lines 34 to 37.

5 A. Yes.

6 Q. And it says --

7 A. That is an example.

8 Q. Phosphoric acid, nitric acid,
9 other kinds of acid mixtures, whatever; right?

10 A. Yes, you can use those.

11 Q. Now, let's return to this
12 passivity problem that we spoke about earlier.
13 One way of solving the problem, according to the
14 patent, is to select an appropriate metal for
15 the top layer and an appropriate etchant such
16 that the metal of the top layer doesn't become
17 insoluble in the etchant; right?

18 A. Would you be more specific about
19 the configuration that you're talking about?

20 Q. Talking about a double layer piece
21 of metal where the problem could arise. I'm
22 saying that passivity problem, the patent says
23 that one way of solving that problem, just one
24 of the ways of solving it is to select an

1 appropriate metal for the top layer and an
2 appropriate etchant, such that you don't get
3 this insolubility of the top layer in that
4 etchant?

5 A. That would be one way you'd try to
6 make this work, yes.

7 Q. Right. And the solution to that
8 problem is the subject matter addressed in
9 dependent Claims 7 and 16; right?

10 Let's look at Claim 7 and 16 on
11 the screen to save you the trouble. And what
12 they both say is that the upper layer of the
13 wiring material must be selected such that the
14 upper layer does not become insoluble in the
15 chosen acid or alkaline etchant; right?

16 A. Well, you may remember that I said
17 a few minutes ago that the application to dual
18 layer metal etchants is described in this patent
19 in the specification as a motivation for
20 thinking about, I guess, what the very broad
21 claim should be. There is nothing in these
22 claims which specifies whether the solubility in
23 acid or alkaline is done in the configuration of
24 the dual layer.

1 It's --

2 Q. This is dependent from claims
3 above it, and we all looked at it. You told us
4 earlier that the claim above it requires a dual
5 layer; right?

6 And, of course, this claim itself
7 says upper layer, which means there's a bottom
8 layer; right?

9 A. I don't read it that way.

10 Q. You think the upper layer means
11 the upper layer of a single layer wire?

12 A. I think that the material for the
13 upper layer is said here to be chosen, so that
14 it will not become insoluble in an acid or an
15 alkaline.

16 So that -- so that --

17 Q. I'm sorry.

18 A. So that means --

19 Q. Go ahead.

20 A. I take a vessel with the acid or
21 the alkaline in it. I take a piece of that
22 metal and I see if it etches or instead doesn't
23 etch.

24 Q. Does the upper layer in this claim

1 refer to the upper layer of a two-layer wire
2 where a wire consists of metal on the top and
3 metal on the bottom?

4 A. The words upper layer wiring
5 material here refer to the material that will be
6 used for the upper layer.

7 Q. Right.

8 A. But the spec -- the description of
9 the result, whether it would be etched fast,
10 slow, whatever or relatively slowly to be
11 called, let's say, insoluble, is only a property
12 of the material.

13 Q. Okay. So is it true, sir, that in
14 Claim 7 and 16, these both require that the
15 upper layer of wiring material must be selected
16 such that the upper layer material does not
17 become insoluble in the chosen etchant?

18 A. Yes. I think under --

19 Q. Okay.

20 A. -- normal conditions. Right.

21 Q. Now, you agreed that it is
22 certainly true that a number of factors can have
23 an effect on the solubility of a particular set
24 of materials used in a multilayer structure;

1 right?

2 A. Yes. There are many factors.

3 Q. One of those factors is the
4 temperature at which the etching takes place;
5 right?

6 A. Can be temperature. Can be many
7 things.

8 Q. Right. Another factor is the
9 identity of the particular etchant or mixture of
10 etchants being used; right?

11 A. Yes.

12 Q. Another factor is the
13 concentration of the etchant on mixture of
14 etchants; correct?

15 A. Yes.

16 Q. And there are probably lots of
17 other factors that I haven't listed; right?

18 A. I'd be glad to list some.

19 Q. That's all right. But there are
20 others; right?

21 A. Yes.

22 Q. Now, in your expert report on
23 validity, the first prior art reference you
24 discuss appears at Page 20 of your report, which

1 is on the screen now.

2 If we could blow up the Section A
3 there. And that's the European '695 patent that
4 you spoke about on direct; right?

5 A. That's right.

6 Q. Now, let's look at pages 28 and 29
7 of your expert report. And in this paragraph
8 that bridges pages 28 and 29, this contains your
9 entire discussion of the validity of Claims 7
10 and 16 in light of the European patent; correct?

11 A. I don't remember if I had more
12 paragraphs than that.

13 Q. I would be happy to show you your
14 report if you would like to confirm it.

15 Turn to page 28 down at the
16 bottom, there is a paragraph that is under the
17 heading six, and it's a single paragraph that
18 spans 28 and 29.

19 A. So, I'm sorry.

20 Q. So is it correct that your entire
21 discussion of the validity of Claim 7 and 16 in
22 light of the European '695 patent is contained
23 in this paragraph that bridges pages 28 and 29
24 of your validity report?

1 A. You're asking me if that one
2 paragraph is everything that I had about
3 validity for?

4 Q. Claims 7 and 16 in light of the
5 '695 patent?

6 A. Well, it appears that that's all
7 that I put into the discussion.

8 Q. And is it correct in this
9 paragraph you never state that the '695 patent
10 mentions the passivity problem?

11 A. Well, the passivity problem is not
12 mentioned in the claims of the '629.

13 Q. I didn't ask that. Would you
14 please confine yourself to my question.

15 A. I'm sorry. So your question is?

16 Q. You never mentioned the passivity
17 problem in this paragraph that bridges pages 28
18 and 29; correct?

19 A. But my understanding of --

20 Q. Sir, can you answer my question,
21 yes or no?

22 MR. GOODWYN: Objection, Your
23 Honor. Again, counsel is interrupting the
24 witness from trying to answer the question.

1 THE COURT: I believe he's asking
2 for a yes or no and then you can explain. Can
3 you answer the question yes or no and then
4 explain.

5 Q. Do you ever state in this
6 paragraph that bridges pages 28 and 29 that the
7 '695 patent mentions the passivity problem?

8 A. It doesn't mention the passivity
9 problem, I explicitly -- and the reason for
10 that --

11 Q. I didn't ask for the reason. We
12 have limited time here. If your counsel wants
13 to ask you about that on redirect?

14 A. I need to explain what my answer
15 means.

16 MR. SHULMAN: Your Honor.

17 THE COURT: A short explanation.

18 THE WITNESS: My answer is that I
19 was addressing invalidity here. That is a
20 comparison as I said earlier between what's in
21 the '629 claims and the elements in those
22 claims, and what's in the prior art. And in the
23 claims, it does not talk about the etchant
24 problem.

1 Q. Now, in this paragraph you also
2 never state that the '695 patent mentions a
3 solution to the passivity problem; correct?

4 A. Yes, it's the same situation I
5 just told you.

6 Q. So the answer is no, you never
7 mention it; right?

8 A. It was not necessary to mention
9 it.

10 Q. I didn't ask that, sir. Do you
11 mention it, yes or no?

12 A. No, because it was not necessary.

13 Q. Now, and you also never state that
14 the '695 patent ever mentions selecting an
15 appropriate metal and etchant to avoid the
16 passivity problem; correct?

17 A. As I read the title --

18 Q. Can you answer my question and
19 then provide the explanation?

20 A. The answer to your question is no.
21 And the title of this paragraph is what I was
22 trying to address, which is the invalidity of
23 these claims. These claims do not mention the
24 things that you're raising.

1 Q. Now, depending upon the numerous
2 factors that we have gone over that, etchant
3 that we went over a few minutes ago, if you use
4 the metal etchants disclosed in the '695 patent,
5 you may or may not encounter the passivity
6 problem; correct?

7 A. Well, that covers it if you say
8 may or may not.

9 Q. Right. Very good.

10 Now, the next prior art reference
11 you discuss in your report is the '275 patent
12 which appears at page 29 of your report, which
13 is on the screen. Do you see that down at the
14 bottom?

15 A. Yes.

16 Q. And is it true that the '275
17 patent no where teaches that the upper layer of
18 a two-layer wiring structure does not become
19 insoluble in an acid or alkaline etchant?

20 A. Yes, I think I explained that the
21 shortcoming of the '275 for anticipation is it's
22 a single-layer structure.

23 Q. Is it true that quote, the '275
24 patent no where teaches that the upper layer of

1 a two-layer wiring structure does not become
2 insoluble in an acid or alkaline etchant, yes or
3 no?

4 A. I'm sorry, where are you reading?

5 Q. From the question that I just
6 wrote on the piece of paper before we got to
7 court.

8 A. Please say it again.

9 Q. Is it true that you, sir, have
10 written that the '275 patent nowhere teaches
11 that the upper layer of a two-layer wiring
12 structure does not become insoluble in an acid
13 or alkaline etchant?

14 A. The question is -- I'm sorry,
15 you're speaking very fast. I'm trying to digest
16 the words correctly.

17 Q. Let's look at your report, page
18 40, sections six, lines five through seven. Can
19 we have that on the screen.

20 Did you write that quote, the '275
21 patent does not teach that a multilayer wiring
22 structure of that, the upper layer does not
23 become insoluble in acid or alkaline etchant,
24 did you write that?

1 A. I certainly wrote that.

2 Q. The third reference that you
3 discuss in your expert report is the '069 patent
4 which you did not refer to today; correct?

5 A. That's correct.

6 Q. So let's not talk about that one.

7 The next patent that you referred
8 to in your expert report was the Japanese patent
9 publication ending in '415, and we didn't hear
10 about that today, either, did we?

11 A. That's correct.

12 Q. So let's skip that one.

13 And the fifth prior art reference
14 that you discussed in your report was another
15 Japanese publication that ended in '811, and you
16 said nothing about that today; right?

17 A. That's correct.

18 Q. Okay. Now, if you would look,
19 please, at your expert report at page 76. If we
20 could have that on the screen, Bill, his expert
21 report at page 76.

22 And down at the bottom of the
23 bottom half of that page there is a Section F
24 that continues for six lines on the next page or

1 five lines on to the next page where you set
2 forth your entire discussion of these two LG
3 products that you testified about on your
4 direct, namely the LT06OV1 and the LT071V1;
5 correct?

6 A. Yes.

7 Q. Okay. And that's the entirety of
8 your discussion on these two products in your
9 expert report; correct?

10 A. Yes.

11 Q. Okay. And what you said here if I
12 understood you correctly is that if AUO's
13 infringement analysis at least with respect to
14 these two products is correct, then in my
15 opinion, the '629 patent would be invalid
16 because of the on sale bar; right?

17 A. That's right.

18 Q. Okay. Now, let me hand you AUO
19 Exhibit 1539, which is a list of all of the
20 products accused of infringement by AUO in this
21 case with respect to the '629 patent.

22 And is it correct, if you could
23 just briefly look through it and look for the
24 designation LT that identifies the product

1 names, and will you confirm for me that LT,
2 whatever number, doesn't appear in this
3 document?

4 A. That's in the model number column?

5 MR. SHULMAN: May I approach, Your
6 Honor?

7 THE COURT: Yes, you may.

8 THE WITNESS: Is that what you
9 mean, right here?

10 Q. Correct. In fact, I can help you
11 out and move this along a little bit. Where is
12 the other one? On the first page of this
13 document, they're all LP numbers; right?

14 A. No, I'm going fast here.

15 Q. Okay. Take your time.

16 A. (Witness reviewing document.) So
17 your question is whether I --

18 Q. Did you find any LT?

19 A. And the answer is no.

20 Q. So the LT products that form the
21 basis for your on sale defense were never
22 accused of infringement according to this
23 exhibit; right?

24 A. Well --

1 Q. Is that correct?

2 A. This is a chart that I have not
3 prepared.

4 Q. Can you answer my question rather
5 than the one you choose to answer. I said
6 according to this exhibit, LT products were not
7 charged with infringement; right?

8 A. I think that's right.

9 Q. Okay. Thank you.

10 Now, during your direct testimony,
11 you were shown -- can we have the Elmo, Bill.

12 You were shown LGD Trial Exhibit
13 380, which was in one of your -- towards the
14 back of your binder that you had on direct. Do
15 you recall that? It's the second to last tab in
16 your book.

17 A. Yes.

18 Q. I'm not going to ask you details
19 about this, but just to refresh your
20 recollection, you were asked about this
21 document. Do you recall that?

22 A. Yes.

23 Q. Okay. And then the next tab in
24 your book is another excerpt from LGD 380 and

1 you were asked some questions about that, too;
2 right?

3 A. Yes.

4 Q. Okay. And is it correct, sir, and
5 these relate to the so-called LT060V1 and the
6 LT071V1 products; correct?

7 A. Yes.

8
9
10
11 In this paragraph, or two
12 paragraphs that bridges pages 76 and 77 of your
13 expert report; correct.

14 A. You said page --

15 Q. Turn to page 76 of your validity
16 report where you discuss these two on sale
17 products.

18 A. (Witness complying.) Yes, I'm
19 there.

20 Q. And in the section that bridges
21 pages 76 and 77, Section F, you never refer to
22 either of these two documents in your discussion
23 of those products; correct?

24 A. Yes, that's correct.

1 Q. And you offered no opinions about
2 those two drawings in your expert report?

3 A. Well, I think in my expert report
4 I said that I looked at all kinds of --

5 Q. Can you answer my question and I
6 didn't finish it, so give me the courtesy of
7 letting me finish my question.

8 A. Excuse me.

9 Q. Is it correct that you offered no
10 opinion about either of these two drawings on
11 pages 76 or 77 of your report, yes or no?

12 A. I don't know whether it was yes or
13 no. I did not explicitly mention these, that's
14 what you're after.

15 Q. During your direct testimony in
16 reference to these two documents, you said
17 something to the effect that the metal wires
18 there were two-layer wires; right?

19 A. Yes.

20 Q. Okay. And you were asked that
21 question at your deposition, and you said I
22 don't know; right?

23 A. I don't remember it.

24 Q. Let's look. Can I have the Elmo,

1 please.

2 This is from page 422 of your
3 deposition transcript taken in April; right?

4 A. I think so.

5 Q. Okay.

6 "QUESTION: Do you know how many
7 layers the wiring of either of these two
8 products -- that's a poor question. How many
9 layers are in the wiring of either of these two
10 products; do you know?"

11 I represent to you, sir, they were
12 talking about the two products we are talking
13 about here.

14 "ANSWER: I don't. I would have
15 to look. For that, I would have to look at the
16 masked files and probably look at the QC charts
17 and the QE charts."

18 That was your testimony; right?

19 A. That was my testimony.

20 Q. And the QC charts and the QE
21 charts are not referred to in this passage that
22 bridges pages 76 and 77; right?

23 A. Correct.

24 Q. And neither are the mask files;

1 right?

2 A. Correct.

3 Q. You also testified on your direct
4 that you made an area calculation with respect
5 to these two so-called on sale products; right?

6 A. I don't remember that.

7 Q. You said it anticipates, so you
8 must have made that 30 percent calculation;
9 right?

10 A. Well, I looked at ways that I
11 understood at that time AUO to be defining area
12 and percent area, which is certainly now been
13 made much more clear by what we've heard
14 yesterday.

15 Q. So the answer is you did make a
16 calculation; right?

17 A. I looked at a number of
18 calculations that might be the way to look at
19 this, that's right.

20 Q. So in your opinion in order to
21 tell the Judge that it anticipated, you had to
22 conclude based upon some calculation that you
23 made that 30 percent was occupied by these dummy
24 patterns; right?

1 A. That's correct.

2 Q. Now, your deposition was taken as
3 we see here on May 2nd, 2009; right?

4 A. Yes.

5 Q. Roughly a month ago; right?

6 A. Yes.

7 Q. And at that point, a month before
8 the trial began, you were asked, "So, have you
9 contemplated a percent coverage?"

10 And I represent to you once again,
11 this is about the same two products.

12 "ANSWER: No, I couldn't. I
13 probably thought about it, but the '629 doesn't
14 give a prescription for calculating the percent
15 coverage that is in the claims. So as I said,
16 the patent is indefinite."

17 That was your testimony; right?

18 A. That was my testimony.

19 Q. And today you're giving us a
20 percentage?

21 A. I'm giving you a percentage today
22 because it's become increasingly clear what the
23 interpretation of area and percent area is by
24 AUO and Dr. Silzars --

1 Q. And you provided us no prior
2 knowledge of that opinion before today; right?

3 MR. GOODWYN: Objection, Your
4 Honor. Again, counsel was interrupting the
5 witness and not letting him finish his answer.

6 Q. I apologize. Go ahead.

7 A. I was attempting to explain how
8 clear it became first from Dr. Silzars'
9 deposition testimony, and then his testimony
10 yesterday, what the various things that AUO's
11 documents had been converging to as a position
12 with regard to area and percent area.

13 Now it is absolutely crystal
14 clear, and so my statement in the direct today
15 came from all of those recent factors that have
16 emerged, his deposition testimony, the way he
17 drew the different patterns on the '629 figures,
18 and the discussion that we all heard yesterday.

19 Q. Okay. Now --

20 A. And excuse me, that's the basis
21 for my statement now.

22 Q. Okay. Now, one of the slides you
23 were shown earlier on your direct examination
24 was this one, Trial Exhibit 1074; right?

1 A. Yes.

2 Q. And this has to do with
3 constructions concerning this area limitation;
4 right?

5 A. Yes.

6 Q. Okay. And up at the top or in the
7 middle, rather, is LG's proposed construction,
8 which says what it says. On the right is AUO's
9 proposed construction which is plain meaning.
10 And then down at the bottom, the indefinite,
11 that's your personal opinion; right?

12 A. It certainly was my personal
13 opinion.

14 Q. And the one above is LG's
15 position, not your personal opinion, your
16 personal opinion is it's indefinite; right?

17 A. No, that's not what it says.

18 Q. Your personal opinion is that it's
19 indefinite?

20 A. My personal opinion is that the
21 use of the term area is indefinite, and that
22 means that there is a great deal of ambiguity in
23 a layer of insulating substrate having an area
24 which I believe is resolved by my own opinion

1 and by LG Display's construction as you see it
2 there.

3 Q. Let's look at the next slide,
4 which was shown, it's LGD629015. And you used
5 this to explain how LG's products don't
6 infringe. Do you recall that?

7

8

9

10

11 Area and said that's where the
12 dummy pattern should be located; right.

13 A. Yes, that's taught in the '629.

14 Q. And you -- if I understood you
15 correctly, you said LG's products don't infringe
16 because the --

17 A. Would you like a laser pointer?

18 Q. No, I'm even worse with those.

19 But the area where the -- the
20 metal that occupies the area where the dummy
21 pattern should be has to be at least 30 percent
22 of all of the metal on the substrate; right?

23 A. Yes, the dummy pattern area, if
24 there is some, within what's essentially the

1 yellow region would have to be 30 percent of all
2 the metal that's seen.

3 Q. And so -- and you concluded that
4 based upon that understanding of the claim, LG's
5 products don't satisfy that 30 percent
6 limitation; right?

7 A. That's correct.

8 Q. Okay. And you used the same claim
9 construction undoubtedly when you analyzed the
10 prior art; right?

11 A. Let me go through this. No, I
12 think it's different in the following sense --

13 Q. It is different; right?

14 A. Please let me explain.

15 Q. Well, let's first establish it was
16 a different claim construction you used when
17 analyzing the prior art; right?

18 A. The prior --

19 Q. Yes or no first.

20 A. I have to think about the odds of
21 how that's supposed to be, because it's not the
22 right question.

23 Q. Let me see if I can help you.

24 Okay.

1 Take it a little bit quicker.

2 Let's turn to your prior art slide. Here's one
3 of them.

4 This is slide LGD 629-019. And
5 down towards the bottom there, you show in
6 yellow in something labeled Figure 1 the dummy
7 pattern area; right?

8 A. Yes.

9 Q. Okay. And what you don't show is
10 how much metal occupies the rest of the
11 substrate; right?

12 A. Well, I can estimate what it is.

13 Q. You didn't. And you have no way
14 of knowing that what's shown in yellow is 30
15 percent or more of all of the other metal that
16 exists on the substrate; right?

17 A. Well, I think the back of the
18 envelope calculation, that would show that quite
19 clearly.

20 Q. Which you did not offer; right?

21 A. No. I didn't have time to offer.

22 Back of the envelope calculation
23 would say the pixel array is transparent, for
24 the most part. Therefore, the amount of metal

1 will not be that much or you wouldn't be able to
2 see light through it.

3 Q. But you never made that
4 measurement, because there's not enough
5 information in that prior art to make the
6 measurement; right?

7 A. I -- I accept that.

8 Q. Very good.

9 Now, let's see what you did here.
10 This is Slide 23, LGD 629-023. And this
11 concerns the other prior art reference, the
12 '275; right?

13 Yes?

14 A. Yes.

15 Q. And Figure 2 of the patent is what
16 you used to illustrate the so-called dummy
17 patterns; right?

18 A. Yes.

19 Q. Now, what you colored in yellow
20 are the dummy patterns; right? Or what you call
21 the dummy patterns; right?

22 A. No, what I colored in yellow was
23 the structure. The light -- it's the light
24 shielding structure that was added there. And a

1 fraction that the triangle at the top would be
2 the dummy pattern according to '629.

3 Q. Okay so the dummy pattern is just
4 this triangular top of the yellow piece of
5 object that's on the screen?

6 A. Yes.

7 Q. Okay. And once again, you don't
8 show the total metal occupied on the substrate;
9 right?

10 A. No.

11 Q. So you didn't make that 30 percent
12 calculation; right?

13 A. No. I can make that 30 percent
14 calculation if I assume Dr. Silzars' definition
15 of area, because that's a blanket area.

16 Q. No. I want you to use the claim
17 construction that you used for purposes of
18 infringement.

19 MR. GOODWYN: Objection. Your
20 Honor, counsel is repeatedly interrupting this
21 witness and not letting him finish his answer.
22 He's not getting the answer he perhaps wants.

23 I'd just ask that the witness be
24 permitted to give a full response to the

1 questions that he's asked.

2 BY MR. SHULMAN:

3 Q. Let me repeat the question. Using
4 LG's construction, which you use for purposes of
5 infringement, denying infringement, is it
6 correct that you cannot make the 30-percent
7 calculation based upon the information contained
8 in Figure 2 of Slide LGD 629-023?

9 A. It would be difficult to make a
10 calculation based on LG's construction in this
11 case, but not difficult on AUO's construction.

12 Q. But you've got to use the same
13 construction, whether it's infringement or
14 invalidity, and you didn't; right?

15 A. Well, wait a minute. This is a
16 situation, as I understand, the -- I think you
17 know I'm not an attorney.

18 This is a situation where there
19 are multiple constructions before the Court, and
20 they have not been resolved. And I thought the
21 issue was that my responsibility is to interpret
22 each prior art reference, each accused product
23 reference, and so on on the basis of the various
24 constructions that are on the table.

1 Q. Okay. Finally, let's look at LGD
2 1080, which was also shown to you on your direct
3 examination. Correct?

4 A. Yes.

5 Q. Okay. I don't expect you to read
6 your whole report.

7 But I've looked through your whole
8 report and I found no -- on invalidity, and I
9 found -- strike that.

10 MR. SHULMAN: Excuse me for one
11 second, Your Honor. Sorry for the interruption.

12 BY MR. SHULMAN:

13 Q. This document LGD Trial Exhibit
14 1080, you discussed when explaining your reasons
15 that LGD doesn't infringe; correct?

16 A. Yes.

17 Q. Okay. And I don't expect you to
18 read through your infringement report right now,
19 because it's lengthy.

20 But I'll represent to you that I
21 looked through your infringement report and I
22 couldn't find any reference to this exhibit in
23 there.

24 A. Well, excuse me. I don't think I

1 said that quite right.

2 In terms of infringement, what
3 this shows is one simple fact that the product
4 didn't have an etchant problem. This doesn't
5 relate to dummy patterns. There are no dummy
6 patterns in this one.

7 Q. So this is --

8 A. In the gate metal.

9 Q. Sorry for interrupting. I keep
10 doing that.

11 Are you finished?

12 A. So I don't recall that this was
13 directly addressing the infringement in my
14 report.

15 Q. So Exhibit 1080 is not relevant to
16 your infringement opinion?

17 A. No, that's not true. The
18 discussion of the patent, the merits of the
19 patent, et cetera, has to take into account, I
20 believe, the specification, which is the
21 technical description of the -- of this etchant
22 phenomenon and also the specification of the
23 claim.

24 And as I said earlier, these are

1 very different in this patent. The claims are
2 extremely broad.

3 What this information in this
4 slide shows is that there was no problem with
5 undercutting with etching with any mouse holes,
6 whatever you want to call it, because this
7 product didn't have that problem.

8 So it relates in the specification
9 of the patent. I'd have to think harder to
10 think whether that has any implication to the
11 infringement.

12 MR. SHULMAN: Thank you very much.
13 I have no further questions.

14 MR. GOODWYN: Your Honor, I just have
15 one quick question for Dr. Rubloff.

16 REDIRECT EXAMINATION

17 BY MR. GOODWYN:

18 Q. Dr. Rubloff, you included as an
19 Exhibit 3 to your invalidity report a list of
20 all the materials you considered. Do you
21 remember right?

22 A. Yes.

23 Q. And it was an extensive list?

24 A. I think I remember it. Yes.

1 Q. And in that list, you also
2 included a list of the mask files that you
3 reviewed?

4 A. I think I must have. That's in
5 the binder?

6 Q. I don't believe it's in your
7 binder.

8 A. Okay. Go ahead.

9 I'm sorry. Go ahead.

10 MR. GOODWYN: Excuse me one
11 second. I apologize.

12 BY MR. GOODWYN:

13 Q. And this was one of the pages in
14 Exhibit 3 to your expert report that identifies
15 the mask files that you reviewed?

16 A. Oh, yes.

17 Q. Do you see that? Do you see
18 Number 76 on this spreadsheet?

19 A. Yes.

20 Q. Is that the mask file related to
21 the two --

22 A. On-sale bar products.

23 Q. -- on-sale bar products?

24 A. Absolutely. I remember the 7160

1 especially now. But, yes, that's the mask file.

2 MR. GOODWYN: Okay. Thank you.

3 No more questions.

4 THE COURT: Doctor, you may step
5 down.

6 THE WITNESS: Thank you.

7 MR. BONO: We call Mr. David
8 Eccles to the stand.

9 THE CLERK: Please state and spell
10 your name for the record.

11 THE WITNESS: David Albert Eccles.
12 D-A-V-I-D A-L-B-E-R-T E-C-C-L-E-S.

13 THE CLERK: Okay. Do you prefer to
14 swear or affirm?

15 THE WITNESS: Swear.

16 THE CLERK: Do you solemnly swear
17 that the testimony you're about to give to the
18 Court in the case now pending will be the truth,
19 the whole truth and nothing but the truth so
20 help you God?

21 THE WITNESS: Yes.

22 THE CLERK: Thank you.

23 DIRECT EXAMINATION

24 BY MR. GOODWYN:

1 Q. Good afternoon, Mr. Eccles.

2 A. Good afternoon.

3 Q. Are you here to testify regarding
4 your opinions about the '160 patent?

5 A. Yes, I am.

6 Q. Before we begin going over the
7 '160 patent and your opinions, could you briefly
8 describe your education, experience and work
9 experience?

10 A. I received a bachelor's degree in
11 electrical engineering from the University of
12 California at Irvine, and studied signal
13 processing.

14 I did post-graduate work at Perdue
15 University. Then I went to work at Hughes
16 Aircraft Company as a design engineer designing
17 display circuits. And I also led projects doing
18 display designs and investigations.

19 This is where I first became
20 familiar with liquid crystal display technology.
21 In approximately 1979, I worked on my first
22 liquid crystal display and started to understand
23 the effects of this, the slow response time of
24 the liquid crystal; and therefore, the need for

1 driving it harder or what's been called later
2 overdrive.

3 So I had experience with that
4 doing -- also doing photometric measurements,
5 and human factor studies and display
6 performance. In 1987, I joined Sony, worked
7 there for about 17 years in doing design of the
8 world's first 2000 line computer monitor used
9 for air traffic control and helped develop that.
10 Worked on the video circuit and video processing
11 as well as photo metric measurements on that.

12 And I also led a project to
13 develop the world's first microprocessor
14 controlled software controlled multi-scan
15 computer monitor for sale in the market in the
16 world.

17 And I also the engineer in charge
18 of manufacturing to build the monitors and
19 introduced some automated camera equipment that
20 would measure and adjust the monitors. And in
21 about 1994, I was asked to take over and develop
22 a TV design group to design Sony's television
23 products for North and South America.

24 So I recruited and built up a

1 group to do that, which ended up making,
2 designing the products for sale in America by
3 Sony, and which was about three and a half
4 million TV products a year. And we developed
5 all the different engineering expertise that was
6 needed and product design procedures.

7 In 2004, I left to start doing
8 independent consulting. My first job was
9 working with the company that had a video
10 processing technology, so I helped them develop
11 a product, and test that out, and show how it
12 would improve the dynamic contrast of high
13 definition TVs, including, of course, liquid
14 crystal flat panels.

15 And I've worked for various
16 companies since then, all in display technology
17 developing new display products and evaluating
18 them.

19 Q. When you mentioned for a couple of
20 different experiences, I think both with Hughes
21 and Sony, that you had experience with
22 photometric measurements. What are photometric
23 measurements?

24 A. Photometric measurements are the

1 way you characterize displays. It's important
2 to characterize them in a way that the eye sees
3 them.

4 There's various ways to measure
5 energy coming from a display. But one way, in
6 particular, is, of course, to measure it as the
7 eye sees, what colors the eye sees. And there's
8 various tests that are run to do that.

9 But it's very important to set up
10 the procedures properly so that you can
11 duplicate and get repeatable results. That's
12 important for -- often in the case of air
13 traffic control, we have to get procedures
14 approved and then sell off the products that --
15 because of the safety issue.

16 Also, and just for TVs or selling
17 products to other companies, you have to meet
18 certain specifications.

19 Q. Well, in addition to your work
20 experience, do you have any other experiences
21 within the industry, for example, related to
22 displays?

23 A. I've been a member of the Society
24 for Information Display, and I've served on

1 committees that evaluate papers and display
2 design, a signal processing display performance
3 for at least 20 years.

4 I was also vice president of that
5 organization. It's the largest organization in
6 the world in display technology.

7 I was a Board member of the Video
8 Electronic Standards Association who sets the
9 standards for inputs, for instance, digital
10 inputs to monitors and video processing, and of
11 course, a member of IEEE.

12 I have published some papers, and
13 I've been invited internationally to teach
14 seminars on liquid crystal display product
15 design which has to do with the electronics, the
16 signal processing, back lights and the
17 performance and study of artifacts that come out
18 based on the different video processing.

19 Q. Do you have some specific
20 experience relevant to the technology described
21 in the '160 patent?

22 A. Well, I think there's three
23 particular areas of my background that in my 30
24 years as a display engineer that are

1 particularly interesting.

2 For instance, video signal
3 processing design, both as an engineer and as a
4 leader for the groups. The -- due to the
5 processing of the video throughout the system.
6 I wouldn't say I was an expert on technology of
7 the liquid crystal, for instance, like we've
8 heard about here today.

9 But I have had extensive
10 experience on how to drive the liquid crystals
11 and what results come out.

12 And so you asked me about the
13 photometric measurements, that was a large part
14 of that process is to accurately measure and
15 characterize the results of the displays.

16 And then, finally, because of my
17 experience and my understanding of the
18 importance of the display product that's
19 actually in TV, that was the most important
20 aspect. So I recruited and set up a group in
21 Sony to which was a visual performance group.

22 We created source material to
23 evaluate displays and TVs and evaluated those
24 displays, measured them, observed them and came

1 up with criteria so that those TVs would be
2 acceptable for sale into the market.

3 MR. GOODWYN: Your Honor, at this
4 point, I'd like to offer Mr. Eccles as an expert
5 in the area of driving in optics for displays,
6 including liquid crystal displays.

7 MR. SHULMAN: No objection.

8 THE COURT: He'll be admitted.

9 BY MR. GOODWYN:

10 Q. Mr. Eccles, you mentioned earlier
11 that you had formed an opinion with respect to
12 the '160 patent. Did you form an opinion with
13 respect to infringement of the '160 patent?

14 A. Yes, I did.

15 Q. Could you explain to me what that
16 opinion is? I'll put up Claim 1 on the board if
17 that helps you.

18 A. As far as Claim 1, looking at the
19 limitations of the claim, I determined that LG
20 does not have a storage for storing the previous
21 brightness level which we can explain later.
22 They do not have a determinator for determining
23 an output brightness level based on the previous
24 brightness level for the same reason as the

1 previous one.

2 And first of all I believe the
3 term substantially equal is indefinite, it's
4 difficult to understand just from the patent
5 language. But even with respect to that, I
6 think there is prior art that also would meet
7 that, so I don't see how that LG could possibly
8 infringe upon that, either.

9 Q. Well, let's take the first one.
10 If you could just briefly explain what your
11 opinion is with respect to why LG Display
12 doesn't have a storage for storing the previous
13 brightness level in its accused products?

14 A. I have looked through each of the
15 specifications of the timing controllers and
16 they all have what's called compression feed
17 forward driving so the previous brightness level
18 is the data is compressed, it's stored as ones
19 or zeros and some other average, or
20 informational data, then it's decompressed and
21 brought back to do a comparison and so,
22 therefore, the storage doesn't actually store
23 the previous brightness levels.

24 Q. And the determinator for

1 determining an output brightness level based on
2 the previous brightness level stored in storage,
3 can you briefly explain why you believe LG
4 Display's accused products don't meet that
5 limitation?

6 A. Well, it refers to the previous
7 one where it talks about the -- based on the
8 previous brightness level, so LG does not use
9 the previous brightness level to do the
10 comparison. But that one also ties in with the
11 next one which talks about substantially equal.

12 LG in my reading of the LG
13 procedures and their timing controller, they
14 measure a response time, and they optimize 10 to
15 90 percent rise and fall time, and by using a
16 probe that measures some absolute energy of the
17 waveform. And they don't actually measure any
18 quantity of light, nor do they calculate what
19 the ideal quantity of light would be to match.

20 Q. Well, with respect to time
21 integration quantity and substantially equal, I
22 know we have seen this a number of times over
23 the last couple of days with Dr. Silzars, but
24 have you provided a quick explanation of what

1 the patent describes as the ideal quantity of
2 light and the time integration?

3 A. Yes, I have.

4 Q. Can you please explain it to me?

5 A. Well, simply in '160 patent first
6 of all talks about ideal quantity of light. So
7 if we draw a waveform during the -- you can see
8 here outlined in red, and the area S is under
9 the curve of the red signal, so this is one
10 frame here, the ideal response would be that it
11 turns on and then turns off. And that's all the
12 light that you get. So the patent defines the
13 ideal quantity of light as S, versus as we could
14 measure instantaneously the brightness as we go
15 along here, but when you add the whole area
16 here, then you get the ideal quantity which the
17 '160 patent refers to.

18 Q. When you say the ideal quantity of
19 light or the brightness, is that the amount of
20 light the human eye perceives?

21 A. That's exactly what the '160
22 patents talks about and that's the reason for
23 their proposed novelty is to -- that we'll be
24 able to match the amount of light that the eye

1 sees.

2 Q. Can you explain to me what the
3 time integration quantity of light is?

4 A. If we go next, if we look at this
5 lower waveform, the S, the actual response of
6 light from the liquid crystal will not go
7 instantaneously. In this way back in the '160
8 patent it looks like the rise time was 30
9 milliseconds or so. So the waveform will go up,
10 but at the end of the frame when the signal goes
11 back to off it will drop down.

12 So the integration quantity of the
13 actual waveform or the actual light output is
14 this area under the green. This will also be
15 integrated by the eye and the idea is to have
16 this green area match the area under the S, but
17 in this case it's smaller.

18 Q. And how do you have the green area
19 be the same as S?

20 A. Well, on the next, if you
21 overdrive, meaning instead of driving to level
22 one you actually put in the input to drive to
23 level two, this is what's commonly known in the
24 industry as overdrive. Since the I think late

1 '80s, at least early '90s, it's been commonly
2 referred to as overdrive.

3 You overdrive the pixel with a
4 slow response time. The light here you can see
5 under S double prime still doesn't get up to the
6 level two, but it at least gets to level one in
7 this diagram and other types of drives it will
8 get higher, other types of liquid crystals.

9 Now, as you see in the frame when
10 it's turned off, the fall time here and there is
11 a little bit larger area, so in this case the
12 '160 patent, this symbol here, the S double
13 prime is about equal to S and this is the idea
14 of the patent is to make these areas equal and
15 they'll look the same to the eye.

16 Q. Now, is the ideal quantity of
17 light measured during a single frame in
18 accordance with the '160 patent?

19 A. Absolutely, it's measured. It's
20 defined here as on, or from off it goes to on
21 and then off, and it's during that one frame.

22 Q. With respect to the time
23 integration quantity of light, it includes both
24 the rising and the falling?

1 A. That's absolutely necessary for
2 the '160 scheme is that you include the falling
3 time, because obviously the light during the
4 first frame is not going to ever be equal to the
5 light that's by the area S, so you include the
6 falling time then you can get close to that
7 ideal quantity of light.

8 Q. Is there any relationship between
9 the time integration quantity of light and the
10 amount of light that the eye perceives?

11 A. Well, that's the idea here is that
12 the time integration quantity is what the eye
13 sees, as long as that's not a small enough area,
14 one or two pixels, then the eye perceives that
15 time integration quantity. And the goal of the
16 '160 is to have that matched the same as the
17 ideal quantity of light.

18 Q. That would be the total amount of
19 light the eye sees?

20 A. That's the total amount of light,
21 yes.

22 Q. Now, is there any description in
23 the '160 patent itself about the time
24 integration quantity of light?

1 A. Yes, it describes it.

2 Q. What does it describe?

3 A. Well, at least it attempts to
4 describe it. Time integration quantity taken
5 from the '160 patent, which is a change in
6 brightness in the moving-state video signal
7 integrated with respect to time, it says the
8 moving-state brightness used for storing the
9 relation is the brightness when the particular
10 pixel changes back to the off state one frame
11 after it is driven from the off state to the on
12 state, that's a little backwards, confusing.
13 What they're saying is they go from off to on to
14 off, so that's what it describes here.

15 And then it mentions, this is in
16 accordance with the passage of a wire frame
17 model over the particular pixel, and then the
18 brightness in the moving state which is used
19 when the relation is stored is the quantity of
20 light equal to the brightness change integrated
21 with respect to time.

22 So this invention obviously was
23 done for CAD models which was a big problem at
24 this time with the slow response of liquid

1 crystals, when you moved an image on the CAD
2 screen, the vertical lines -- if you move it
3 horizontally the vertical lines would disappear
4 or blink and come back when you stopped. It
5 also caused a problem when you rotated in 3D
6 which you often did with CAD, so all directions
7 did that. So this problem is being addressed by
8 this patent.

9 So also mentioned in here, moving
10 video images, but in my opinion, that was
11 probably an afterthought. Because there is not
12 really sufficient information and descriptions
13 in here that would address that. In fact, it
14 creates some problems.

15 Q. Well, moving video images, for
16 example, won't always be from off to on to off;
17 isn't that right?

18 A. That's hardly ever the case.
19 They're usually from different gray shades to
20 gray shades.

21 Q. What do you mean from different
22 gray shades to gray shades, or gray level to
23 gray level?

24 A. Rather than going from zero

1 brightness to full brightness, let's use an
2 eight bit DAC, we'll talk about level zero is
3 off or black and level 255 is full white. So
4 usually those actual levels don't occur on video
5 signals, they're say go from 50 to 100 and then
6 goes to 200, so they jump around because video
7 is so full of different information.

8 Q. Does the '160 patent explain how
9 to determine a time integration quantity of
10 light for that type of a situation?

11 A. Well, I think that's where it's
12 unclear. I made a drawing to show the
13 importance of that, to see that. Here is a case
14 where we're going from L1 to L2 back to L1 with
15 the ideal quantity. So you can see in red if we
16 then decide to overdrive that to level three,
17 we're going to get -- the response time is going
18 to go up to level three, and then fall back
19 down.

20 So in this case, the time
21 integration quantity would be the area shown in
22 green here which is the area under this curve.
23 Then this is the case where it goes from the
24 previous level to another level back to the

1 previous because we read in the text it defined
2 going from off to on to off, it wasn't so
3 specific or specific at all about gray levels,
4 so one interpretation could be just go back to
5 the level you started at.

6 Q. Would there be a different result
7 if you went back to zero?

8 A. If you go, you do what the text
9 says and go back to off. I have shown an
10 illustration here. Then there would be a
11 different amount of area, you would need to
12 drive it higher to L4 -- if we could show the
13 next picture -- to get the fall time to go back
14 down. This is the light that you would measure
15 under just the green here and, therefore, you
16 would have to calculate a higher overdrive level
17 to load the lookup tables for the patent.

18 So whether you pick the previous
19 state or an off state for the frame two would
20 make a difference, there is a different area and
21 you would have to have a different drive level.
22 So that's why I think the '160 was not so
23 specific about video. It's pretty clear about
24 wire frame, off to on to off, but it's subject

1 to interpretation or experimentation to do gray
2 to gray levels.

3 Q. Is it important to know whether
4 you go either back to the previous level or back
5 to zero in determining the appropriate overdrive
6 level?

7 A. To determine the overdrive in
8 accordance with the '160 patent it's absolutely
9 essential because as you can see, I have shown
10 here, you might determine level three is
11 appropriate or level four. This determination
12 has to be made first before you can make
13 measurements to load the lookup table.

14 Q. Did you review Dr. Silzars'
15 testing methodology and measurements?

16 A. Yes, I did.

17 Q. Do you have any opinions about his
18 methodology?

19 A. Well, I see a number of errors, so
20 I'm very hesitant to believe the data. As I
21 mentioned, I have had extensive experience in
22 photometric measurements. I think there is a
23 basic process that's usually followed. First
24 you do a setup and design of experiments, then

1 you would identify procedures. And if it's
2 important, an issue for like a company or to
3 sell off a product, you would write out the
4 procedures identifying the equipment and
5 actually have them approved by a quality
6 engineer. I would do that at a company so that
7 you know the procedures are right.

8 You, of course, need to calibrate
9 the equipment so that you know both that your
10 results are accurate and what the tolerance in
11 that accuracy is. You would take the data, you
12 would do the analysis as outlined in the
13 procedure and then finally you would calculate
14 an experimental error when you're done. You the
15 often do measurements and get three digits.
16 Certainly photometric measurements are not
17 accurate to three digits. You need to know what
18 the experimental error is, depending on the test
19 either plus ten percent or minus ten percent
20 might be quite good, sometimes it might be
21 worse.

22 So I guess first of all, you asked
23 me about the measurements, I had concerns.
24 First of all, I don't see the evidence of those

1 steps in the procedure done. And one of the
2 glaring ones is the calibration of the
3 instrument.

4 I recently read in Dr. Silzars's
5 deposition that he said he used a linear
6 photodiode.

7 Q. Is there a problem with using a
8 linear photodiode?

9 A. A linear photodiode is not what
10 the eye sees. And I believe the '160 patent is
11 ideal quantity of light and what the eye sees.
12 A linear photodiode measures radiometric
13 measurements. It measures the energy and where
14 the photometric measurements are done if they
15 want to measure what the eye sees with what's
16 called a photometer or an instrument, it could
17 be the same photodiode, but it's calibrated to a
18 photooptic curve, what your eye sees.

19 So the problem is if you look at
20 these waveforms, these are collected with the
21 photodiode. If you use a photometric
22 instrument, then your eye is less sensitive at
23 the lower light levels, so actually this is --
24 these numbers would be a little bit lower at the

1 lower light and then your eye is more sensitive
2 at the higher light levels, so the shape of this
3 curve would be changed somewhat.

4 So that's a fundamental problem in
5 that I believe the numbers that I see in the
6 results using the photodiode are not depicting
7 what the eye sees, therefore, the calculations
8 and measurements I don't see how that can be
9 related to the ideal quantity of light.

10 Q. You also mentioned that you
11 reviewed Dr. Silzars' deposition testimony. Did
12 you review anything in his testimony about
13 disabling an ODC function during his testing?

14 A. Well, he made measurements with
15 and without overdrive enabled, yes, and that's
16 in his report.

17 Q. Did he also -- was there a feature
18 in -- in the backlight that directed -- that
19 would actually change the amount of light
20 provided based on the picture and whether or not
21 he enabled or disabled that?

22 A. What you're a talking about is the
23 DCR function, the dynamic contrast ratio, and he
24 mentioned in his deposition, I believe in his

1 testimony as well that he disabled that. And
2 the function of the DCR is to adjust the
3 backlight brightness according to the level of
4 brightness on the screen. And that's to make
5 dark scenes darker and bright screens brighter.
6 That's appealing for TV signals. It wouldn't be
7 used for a CAD system, but it's appealing for
8 TV.

9 If you disable that, it's
10 difficult to get measurements because we are not
11 sure what the actual display would show when
12 it's sold into the market. And so I think
13 that's another reason that the numbers would be
14 different if they had been left like the product
15 is when it's sold.

16 Q. Well, with respect to the ideal
17 quantity of light, were there any problems in
18 your opinion with respect to Dr. Silzars'
19 calculations in his testing?

20 A. Once the measurements were made,
21 which I explained I have doubts about the
22 accuracy of those, there were also some problems
23 I see with the calculation method according to
24 the definitions in the '160 patent.

1 Q. What are those issues?

2 A. Well, here is the actual images
3 from Dr. Silzars' report, and on the left, we
4 can see this is where the block is, what he
5 calculated as the ideal quantity of light going
6 from L1 to L2. The actual ideal -- actual
7 quantity of light during frame one as you can
8 see on the right, I have included the hatched
9 area at the bottom. This is because light is
10 light, the eye sees it, and when you turn it on
11 to a level two, that's the amount and then you
12 have a perfect response. That's the amount of
13 light that will be seen during frame one, from
14 zero to L2, that's actually what you see. So
15 this quantity on the left is I think maybe a
16 mathematical quantity, but it is not the ideal
17 quantity of light.

18 Q. What about Dr. Silzars'
19 calculations for the time integration quantity
20 of light?

21 A. I should point out that the levels
22 here recorded are going from 50 to 225. That's
23 why I mention it does not start at zero. I'm
24 not sure if this level is zero in his

1 measurements, but wherever zero is, it was not
2 included.

3 So if you -- the next slide or the
4 next button push will show when you have a
5 response time, this is actual measured response
6 time, the same kind of calculation was done by
7 doctor -- in Dr. Silzars' test results where
8 actually what the eye sees would be what is
9 outlined here that has additional areas, so once
10 again, the amount of area is different, you get
11 a different number in the calculation.

12 Q. When you say it's a different
13 number, would it be significantly different?

14 A. Well, as you can see here, I'm not
15 sure if this is to scale, but yes, it's going to
16 be different, both of them are different
17 numbers, so it's hard to take this data,
18 especially in light of I don't believe the
19 numbers are actually correct in the first place,
20 it's hard to say and compare those.

21 But if you took different
22 conditions like one from 150 to 200, those would
23 be vastly different. So I think here you can
24 add more area so it's kind of going to make the

1 ratios closer together I guess if I had to
2 predict, but I couldn't come up with a number.

3 Q. Well, in addition to the
4 calculation for the time integration quantity
5 and the ideal quantity of light for when
6 overdrive was enabled, were there any other
7 issues that you had with respect to Dr. Silzars'
8 approach to testing?

9 A. Yes, there is one more issue. You
10 can see here. The input level is level one,
11 then it went up to level two, then the input
12 went back to level one again. However, as you
13 can see, if you push the button on the right --
14 go back, I think we missed -- this is with
15 overdrive enabled. So what happens is you go
16 from level one to level two, but as you can see,
17 barely see and you heard Dr. Silzars explain in
18 his testimony that the level during frame two
19 that was applied to the liquid crystal itself
20 was a different level than what the input was.

21 He, of course, applied the input
22 again, level one, but in this case you can see
23 that the overdrive was enabled. Therefore, the
24 waveform would go down a little bit below the

1 original level.

2 So in summary, I mentioned that
3 the '160 patent was not clear to go back to
4 level one or back to zero, he did neither of
5 those, he went to a different level, whichever
6 the lookup table in the product supplied.

7 Q. If you're trying to measure the
8 time integration quantity of light, what's
9 actually being omitted from a display, is the
10 level into the TCON or the level that's provided
11 to the pixel the relevant number?

12 A. Well, the relevant level is what
13 level it's going to occur on the display, which
14 is related to the voltage that's supplied to the
15 liquid crystal. I think the point here is I
16 heard Dr. Silzars talk about super position.
17 Super position means, for instance, you could
18 measure one frame and measure the results during
19 the fall time according to the '160, then you
20 could do another frame and do it, then you could
21 add the results together.

22 This would make it really
23 impossible to separate out and find what the
24 actual ratios should be by driving it to a

1 different level after. So clearly in the '160
2 patent it doesn't even talk about using an
3 overdrive level for the second frame.

4 Q. Did you create a demonstrative to
5 explain that issue?

6 A. Yes, I did.

7 Q. Okay. I believe that's on the
8 screen now. Can you explain or does this --

9 A. So -- so, first of all, here's
10 what was actually supplied to the liquid
11 crystal, and therefore, the resulting output
12 brightness on the left and Dr. Silzars' testing.

13 So I -- as I mentioned on the
14 upper right, you could go, and if -- you could
15 push the button. You could do -- continue an
16 overdrive of L3 and then return to L1 and
17 calculate the area underneath it.

18 Or you could -- if you returned to
19 the level zero, then you would calculate an area
20 there, and you'd need to drive to a different
21 overdrive level. So I've overlaid results that
22 Dr. Silzars had.

23 And you can see there's a
24 difference in area either way you do it. So, in

1 my opinion, there's three different methods
2 here. Three different set-up conditions and
3 three different results.

4 Q. Now, with respect to Dr. Silzars'
5 testing with the overdrive disabled, did you
6 have similar issues to his testing?

7 A. Well, not quite as bad, but the
8 same errors. If you talk about the ideal
9 quantity of light, of course, going from 50 to
10 225, the actual light the eye sees is in frame
11 one here, which is at a level 225.

12 His measurements comes up with, I
13 guess, two or 175.

14 Q. Okay. And similarly with respect
15 to the time integration quantity of light?

16 A. So if you look at the time -- time
17 integration quantity of the actual response in
18 Dr. Silzars' measurements, you can see here,
19 once again, this is without overdrive;
20 therefore, the level one is applied after to the
21 display.

22 And that's what the light outputs.
23 So -- so to -- you get this area, but again it's
24 missing the glare below that the eye sees. So

1 the eye would actually see what I've outlined
2 here on the right with the cross-hatch area. It
3 would be in addition to that area.

4 Q. So that would result in a
5 different time integration, quantity of light
6 that he included?

7 A. Absolutely. Both numbers would be
8 different.

9 Q. Now, the examples you have gone
10 through were going from a level of 50 to 225
11 back to a low level again. Did you also have
12 some opinions regarding Dr. Silzars' testing
13 methodology and calculations with respect to
14 starting at a high level and going to a low
15 level?

16 A. Yes, I did.

17 Q. What are those opinions?

18 A. I could show you that on the
19 next -- next picture.

20 Okay. So, first of all, this --
21 the level is going from 200 to 75. So level
22 three is 200 going down to level 75.

23 So the ideal quantity of light
24 Dr. Silzars calculated in the area shaded in

1 blue on the left. However, during that --
2 remember the ideal quantity is looking at an
3 ideal response.

4 So during frame one, the
5 brightness level is at 75. So if you calculate
6 the area here, that's 75. So the eye actually
7 sees 75 during frame one.

8 So here, again, the very basis for
9 the measurements are incorrect that this is what
10 the ideal quantity of light should be.

11 Q. Well, using Dr. Silzars' testing
12 methodology, would the ideal quantity of light
13 for a signal going from zero to 250 back to zero
14 be the same as the ideal quantity of light going
15 from 250 down to zero back to 250?

16 A. Well, that shows that this is
17 purely nonsensical. It's measuring an area up
18 here that's not light.

19 Because you would get the same
20 result if you were going -- I'm not sure the
21 numbers that you said, but if you started it at
22 100 and went to 50, you would get a 50. If you
23 started at 50 and went to zero, you'd get a 50.

24 And, obviously, that light is

1 different to the eye. And so this makes no
2 sense to me to use this. It's purely what the
3 eye would see during frame one.

4 Q. How about with respect to the time
5 integration quantity that Dr. Silzars calculated
6 when going from a high level to -- to a low
7 level?

8 A. Well, unfortunately, that was
9 upside down as well in his test report, I am
10 afraid. Shown here, he measured the area that
11 was above the curve whereas clearly the time
12 integration quantity, as I show on the right, is
13 the instantaneous brightness integrated over
14 time.

15 So how do you measure that
16 brightness? You measure the instantaneous. You
17 make a curve and then you sum that up, which is
18 shown here, the area under the curve. This is
19 what is actually seen by the eye during that
20 time frame.

21 Q. Okay.

22 A. So, once again, the basis of the
23 measurements are wrong, and the ratio doesn't
24 make sense, in my opinion.

1 Q. Well, you mentioned with respect
2 to the overdrive enabled that it didn't go back
3 to the same level?

4 A. Right.

5 Q. Was the same issue -- did it occur
6 with respect to the high level to low level
7 during Dr. Silzars' testing?

8 A. The same problem occurs, if you
9 push the next button. The level after
10 correction, the proper level was applied to the
11 input or the intended level L3.

12 But what happens, when it went to
13 the look-up table, it's onto the next frame,
14 frame two and overdrive automatically puts in a
15 different level. I don't know what that is, but
16 you can tell on the measurement results that the
17 brightness went to a higher level for the next
18 frame.

19 So the result, as I've shown on
20 the right, if you had gone to the same level,
21 then this curve would have been a little bit
22 lower. And you'd have a little bit -- I'm not
23 sure if it would be less or more area under the
24 curve. Any way, it would be different.

1 So the fundamental problem here,
2 too, is that according to the definition of the
3 '160 patent, it's neither going to the previous
4 level nor to -- I don't know what is -- what
5 it's going to. It's just going to a different
6 level. That doesn't make any sense.

7 Q. With respect to the overdrive
8 disabled, did you have any opinions with respect
9 to the methodology Dr. Silzars applied to his
10 calculation?

11 A. Well, okay. I think you see the
12 pattern now if you look at the situation when
13 it's disabled.

14 Once again, the light measured was
15 above the curve, whereas the actual light, the
16 ideal quantity of light is what -- actually seen
17 by the eye is down here, which is -- should be
18 level 75. And the same exact problem with
19 measurements of the actual, only there was no
20 overdrive level to go to.

21 So, but once again the
22 measurements were made incorrectly, at least the
23 calculations were made incorrectly.

24 Q. Well, let's go back to the '160

1 patent itself. You indicated that it was your
2 opinion that substantially equal was indefinite.
3 Why is substantially equal indefinite?

4 A. Well, the '160 patent doesn't
5 really -- for instance, it doesn't give a
6 number. So I don't -- substantially equal,
7 let's look at the language in the claim.
8 Substantially equal level refers to a level,
9 which is not completely the same, but can be
10 accepted as a substantially equivalent level.

11 And then it goes on to say and
12 includes a level, which is closer to an ideal
13 quantity of light than no preventive measures
14 are taken.

15 The second part of that is clear
16 that it's got to make an improvement upon no
17 overdrive. But the first part substantially
18 equivalent level can be accepted as
19 substantially equal level, can be accepted as a
20 substantially equivalent level.

21 First, can be accepted, that's
22 subjective, unless you give some criteria for
23 that. Substantially equivalent, it's like a
24 circular argument to -- using the same words

1 or -- to define the words. It's -- it doesn't
2 make sense.

3 And then the last part of the
4 claim of the -- is closer to -- is required, but
5 that often resulted with prior art overdrive.
6 And certainly it does today with prior art as
7 the rise tends to get faster. The whole purpose
8 of overdrive is to over drive.

9 So you're going to get instances
10 where the brightness is higher or the time
11 integration quantity is higher during that
12 frame, and some instances where -- when it's
13 lower.

14 So, and this way reading the whole
15 description, it's certainly indefinite.

16 Q. Well, now, do you understand that
17 AUO has proposed that the construction be only
18 part of that sentence, and they've omitted and
19 included a level which is closer to an ideal
20 quantity of light than no preventive measures
21 are taken?

22 A. Yes, in reading claim
23 constructions, I noticed that. And that they're
24 clearly -- that clearly ignores the text in the

1 patent.

2 So...

3 Q. Do you have an opinion as to
4 whether that's an appropriate -- it's
5 appropriate to ignore that text?

6 A. Well, it's certainly not
7 appropriate to ignore it when you're considering
8 the patent for invalidity or infringement. I
9 don't know the legal process or terminology for
10 what the claim terms are. I know I've been told
11 that, but I am afraid I just don't have a good
12 understanding of that.

13 In my understanding, that's not an
14 appropriate claim term, because it ignores part
15 of the description in the patent.

16 Q. Well, if you add that language,
17 does it change the meaning?

18 A. Well, yes, it does. And that
19 would certainly have to be added to the AUO
20 claim construction, whether it's in the term or
21 whether you just include it when you do the
22 analysis.

23 Q. Well, what does or does the '160
24 patent provide any examples of substantially

1 equal?

2 A. Well, I'm not sure it provides
3 examples of substantially equal, but it provides
4 examples of acceptable. You can see on Figure 3
5 in the patent, and then there's a waveform
6 corresponding, as you can see on the right. It
7 describes, for instance, Model A.

8 It measured some liquid crystal
9 displays and showed the data for it. You can
10 see Model A is mentioned, and then the light
11 quantity ratio, which is in Column 64 is 1.02,
12 which means there's only a two-percent variation
13 between the ideal quantity of light and the time
14 integration quantity measured as the '160
15 defines it from off to on to off.

16 And here they put a symbol zero,
17 which in the text says the symbol zero indicates
18 that almost no flicker is visually perceived.
19 Once again, this is talking about the wire frame
20 CAD model where you move an object through the
21 field, which is visually full bright color on
22 black.

23 So they're saying that although
24 you can observe flicker with two-percent match,

1 it's almost no flicker. So I think this means
2 it's pretty good.

3 So in one sense, maybe that's what
4 they meant by ideal quantity. I'm not sure.

5 But that -- that's an indication
6 that that's maybe what they meant.

7 Q. All right. Substantially equal or
8 ideal quantity?

9 A. I'm sorry. Substantially equal to
10 an ideal quantity.

11 You can further see here that
12 there's more data on -- for instance, Model B
13 has a light quantity ratio of 81 percent, which
14 is 19 percent lower than the ideal quantity.

15 And in here, they say it's an "X",
16 'X' indicates that intensive flicker is
17 perceived. So, obviously, that is not
18 acceptable per the authors of the '160 patent.

19 Q. In fact, the title of the patent
20 is directed to solving flicker; isn't that
21 right?

22 A. That's correct. And as I
23 mentioned, I'm sure it was written because of
24 the CAD displays. They wanted to improve the

1 wire frame displays.

2 Q. Well, we've seen different numbers
3 about what's perceptible and what's not
4 perceptible. Have you created a demonstrative
5 that would help explain to how you can determine
6 what is visible to the human eye?

7 A. Well, first, if I could explain
8 over here. I've made kind of a summary about
9 what's acceptable. But notice that even though
10 5A is acceptable per the per this table, in the
11 '160 patent, it says -- it indicates almost no
12 flicker is visually perceived.

13 As a video display, this would be
14 horrendous and would not be acceptable. It
15 would have smearing. We call motion smearing.

16 No way would this be accepted as a
17 video display. And, also, in the LG adjustment
18 process, they wouldn't accept this, either.
19 They would try to make the rise times go as fast
20 as they could before accepting this, if they
21 accepted it.

22 Q. So were you explaining that the
23 reason it's not acceptable is because of rise
24 time or for some other reason?

1 A. Yes. The reason it's not
2 acceptable, because the rise time is too long.
3 The frame time is 16 milliseconds. But the rise
4 time is 18 and a half milliseconds. And the
5 fall time is 10 milliseconds.

6 It's just too slow.

7 Q. Okay. Back to the issue of being
8 able to perceive images.

9 Did you create a demonstrative to
10 try to show what is perceptible to a human eye?

11 A. Yes, I did. And, believe it or
12 not, this is what a display engineer gets a real
13 kick out of or has fun with.

14 So I came up with these diagrams.
15 The one on the left is Dr. Silzars' map with the
16 golf ball flying through the air. And
17 interestingly enough, we actually did this at
18 Sony.

19 We took some high definition
20 footage with slow-motion footage from sports,
21 both golf balls flying in the air as well as a
22 baseball. And we took measurements or we
23 simulated different overdrives on displays, and
24 then evaluated them visually.

1 Because that's really what it
2 comes down to. You can do all the measurements
3 in the world, but what does a TV look like is
4 how you judge it and decide if you can sell it,
5 and how good the video performance is.

6 So now Dr. Silzars -- this is his
7 curve from also on the left. And he put an 80
8 percent under the first area here up to frame
9 one.

10 That is not precisely what the
11 '160 patent describes. As we've seen, the
12 patent describes the rise time and then the area
13 under curve for the fall time.

14 So the 80 percent, if it were
15 applied according to the '160, that might be a
16 total of 95 percent or something. I'm not sure.

17 But at any rate, we did do the
18 test like was illustrated here where the first
19 frame was some percentage. And what we found is
20 when the golf ball moved -- first of all,
21 Dr. Silzars' mentioned it does get fuzzy.

22 And the reason it gets fuzzy is
23 because the front, for instance, would be gray.
24 But if you overdrive it too much, then the front

1 will be white.

2 And so we found actually it was
3 very sensitive to the one -- to the higher, the
4 whiter. People would notice the front of. It
5 was too wide when it was above 110 percent.

6 In fact, I remember a particular
7 case where we had a 113 percent, and one of the
8 executives came in and said, "That's a problem."
9 He didn't like it. We lowered it to 110, and he
10 was okay with it.

11 Q. Another problem that occurs on the
12 trailing edge of the golf ball, especially as it
13 goes through the sky, that's even a worst
14 problem, because it's brightness over the darker
15 sky.

16 So in this case, we found we had
17 to be within ten percent. Another thing that we
18 did was we used a roulette wheel. We used the
19 Wheel of Fortune from the TV show and we used a
20 car wheel with spokes and slowing down.

21 And so what we'd look for here is
22 to the numbers, do they turn gray and then they
23 get white. Again, when it stops in particular,
24 the roulette wheel helps because we can see the

1 lines disappear and then come back as it slows
2 down.

3 So our goal was to have the
4 numbers be crisp and be able to -- to see the
5 lines and the wheels, particular spokes in a
6 car.

7 Q. In fact, it looks like you can see
8 those spokes graying out here, can't you?

9 A. Right. That's a natural effect.
10 They blur and then come back.

11 And so this occurs. There's
12 various frequencies in here. Sometimes it's one
13 frame. Sometimes it's two, three, or four.

14 But, in general, we found we had
15 to even improve the brightness of the first
16 frame to within five percent to make these
17 numbers look crisp and not so blurry.

18 Finally, we built both CAD
19 displays as well as often HD TVs were used for
20 CAD systems. And so we looked at the wire frame
21 model and as you look at -- we had a car drawn
22 here. As the car moves horizontally, the
23 horizontal lines are okay, but the vertical
24 lines get dim.

1 And as mentioned in the '160
2 patent, they found when it was within two
3 percent, it was acceptable. We found a very
4 similar number here.

5 So we actually found, depending on
6 the application and what video you see, the
7 range of acceptable brightness in the frame
8 could vary less than ten percent or even down to
9 two percent.

10 Q. Now, the '160 patent, does it
11 describe any of these applications specifically?

12 A. Well, it does mention the CAD
13 models. It's this one.

14 That's the Table 3 that shows two
15 percent was acceptable. Table 3 is not exactly
16 what the situation would be nowadays, because
17 rise times are much faster. But yet, the
18 results that we had was done in the early 2000s,
19 so maybe similar results.

20 Also, I might mention that we
21 found in the sky, especially that we needed to
22 use an eight bit of color, 256 levels, when it
23 was reduced, of course, to 6 bit. The
24 difference was 1.6 percent between pixels, and

1 everybody can see the contouring lines.

2 Seven bit was getting to be
3 acceptable, but it was generally used eight
4 bits, which is like .4 percent difference
5 between levels, which is not visible.

6 I think Dr. Silzars mentioned that
7 just noticeable differences of two percent or
8 maybe less than that depending on the set-up
9 conditions. That's about right.

10 Q. With respect to moving video
11 images, is there a problem with trying to
12 calculate the time integration quantity of light
13 from moving images that use, for example, a
14 feed-forward technique?

15 A. Well, yes. With the -- there's
16 always a problem.

17 So you make an assumption as an
18 engineer what you're going to do. The '160
19 patent doesn't really clearly tell what to do.

20 Once again, it was clearly written
21 for CAD models. And when you apply it to video,
22 it's somewhat ambiguous or indefinite. I did
23 make a --

24 Q. A demonstrative?

1 A. -- demonstrative that you can
2 show. So in a feed-forward overdrive what it
3 does is you have a level that you're driving to,
4 a level two here. Then instead of going back to
5 the original level or to zero on video, you're
6 going to have another step come next. Let's
7 say, I guess, it's level four.

8 So what happens when you go from
9 this level to the level four, the actual
10 response that I've shown here is at some
11 different location. If it's really slow, it
12 will be lower. If it's fast, it will be higher.

13 So in this case, the rise time is
14 less than the frame time of 16 milliseconds.
15 More like current technology.

16 So as I've blown up here, if you
17 take a look just at this corner right there,
18 here's where the actual response is. It's at
19 level three.

20 Now, you've got to calculate what
21 level of overdrive we're going to use for the
22 next frame. So if you put in the overdrive
23 calculated based on the level two, which is what
24 the input is, which is what's fed to the look-up

1 table.

2 So that's what's actually done
3 with a feed-forward overdrive scheme. If you
4 push the button, you can see that the ideal
5 level would go from here to there or intended
6 level.

7 However, the instantaneous
8 brightness of the liquid crystal is at level
9 three. That's because the liquid crystal
10 capacity cannot change instantaneously.

11 And like it or not, that's the
12 brightness that's coming out at that instant.
13 So if you apply that amount of overdrive, it's
14 actually going to go lower than level four. And
15 you can see that there's more errors here.

16 So these errors are going to add
17 up as you go. If you went down, it would be
18 different. It would still be an error.

19 So it's problematic applying
20 feed-forward overdrive to video displays. And
21 so you make some -- if you do have that
22 situation, you make some decisions to minimize
23 the amount of overdrive.

24 And really the only way to do that

1 is to look at the displays, which is commonly
2 done and has been done for all displays, and
3 prior art as well. It's always going -- going
4 to be a visual check to see that you haven't
5 caused some strange problems like this, which
6 often occur.

7 And this can cause even problems
8 with different colors if your shading, because
9 the sensitivity is different of different
10 colors. You could get strange hues occurring.
11 What's supposed to be gray, it might get
12 greenish or reddish.

13 Q. The color changes?

14 A. You would get color changes due to
15 overdrive. So you've got to look at all that
16 and sometimes just turn it down. You can't do
17 as much as you want, because you cause other
18 problems.

19 Q. Well, now, I'll get to that later.
20 Excuse me.

21 Let me first go on to the next
22 issue. In addition to the problems with
23 understanding the meaning of time integration
24 quantity and substantially equal, you mentioned

1 earlier that there were some elements that were
2 missing from LG Display's accused products.

3 And so, therefore, they don't
4 infringe. And I believe you went through and
5 said the storage for storing and a determinator.
6 Can we go through, first, the storage for
7 storing a previous brightness level and perhaps
8 you can explain to us how you came to the
9 conclusion that LG Display's accused products
10 don't meet this limitation?

11 A. Well, I think, first, we need to
12 go to the claim constructions. I don't think
13 the storage is an issue, but the brightness
14 level evidently is, where in the claim term it
15 says brightness level. LG calls it a gray scale
16 value or luminance value, or it could be a
17 brightness value.

18 Right. Brightness level, I think,
19 is maybe a better word.

20 AUO has level of intensity of
21 light. Intensity of light is something the eye
22 perceives that's an output from a display.
23 True, the gray scale value results in a level of
24 intensity of light, but I think this is a

1 misunderstanding in what the patent is talking
2 about.

3 It's talking about a brightness
4 level from a storage. It's a digital or it's a
5 voltage.

6 Q. Well, it's also speaking about the
7 brightness level. In fact, we'll look back at
8 the claim.

9 A brightness level of the video
10 input signal is the video input signal related
11 to the light emitted, or is it actually the
12 light emitted?

13 A. It's related to the light emitted.
14 It's a hydrodynamic through all the process of
15 the display, and then the drivers to the liquid
16 crystal as well. And then it will result in an
17 intensity level output.

18 So that's how I read the AUO
19 construction. It's talking about the light out.
20 So I think it was a misunderstanding here.

21 Q. Okay. Now, with respect to a
22 storage for storing the previous brightness
23 level of a video input signal through said
24 logic.

1 A. I think it's pretty clear what the
2 storage is for storing the previous signal.
3 Once again, the AUO language has light
4 intensity. That would need to be changed in
5 order for their definition to be valid.

6 Q. You don't actually store a level
7 of light in memory; is that right?

8 A. No. You store a voltage value or
9 what we call a gray scale value digitally.

10 Q. Well, now how does LG Display the
11 timing controllers store compressed data?

12 A. Well, I prepared an explanation of
13 how it works on this demonstrative. First of

4 Opinion with respect to that
5 assertion.

6 A. I didn't understand him to say
7 that, but I can address that. This, of course,
8 could occur in displays.

9 Q. Before we go there, what did you
10 understand -- you were in the courtroom, what
11 did you understand Dr. Silzars to say?

12 A. I believed him to say that this
13 recovered data if it was displayed it would look
14 terrible, it's nothing like the original, which
15 is true. And the reason is it's only overdrive
16 calculation data, it's not the actual data,
17 that's what I believe he said.

18 But I can address your question.
19 Yes, this would certainly would occur, for
20 instance, you go to analog signal conversion,
21 there is going to be all kinds of noise or black
22 and white. There is also in certain kinds of
23 animation they use on off pixels or shading to
24 create shades rather than just a plain area.

1 There is also things that happen
2 in the video scenes, explosions and things and
3 when you did MPEG processing and unprocessed the
4 MPEG --

5 Q. Encoding?

6 A. When you encode an MPEG and then
7 decode, it's going to have some artifacts, so
8 certainly these kind of things occur. I think
9 this is not unusual video.

10 Q. Are there also types of images
11 that could perhaps be displayed that may have
12 that type of -- those numbers?

13 A. Well, as I mentioned, like
14 computer generated video, or animations would
15 use that. There is all kinds of things I can
16 think of. If you take a close look at the TV,
17 that's got that kind of data or noise, it might
18 be noise like I mentioned with an analog signal.

19 Q. What about an explosion or picture
20 of an explosion on a television?

21 A. Yeah, those things happen and you
22 get a lot of crazy artifact, mostly because the
23 satellite and cable companies don't broadcast in
24 -- they do a lot of compression themselves with

1 MPEG and there can be some really strange
2 artifacts because they're trying to save
3 bandwidth to get more channels and save money so
4 they didn't put the perfect image up like you
5 may get with your Blue Ray player.

6 Q. In combination with not having
7 storage, I believe you indicated that LG
8 products don't have a determinator?

9 A. In the sense of the '160 patent
10 they don't have a determinator. Let's look at
11 the claim construction. LG mentions as it does
12 in the patent that the determinator, you can
13 apply the next brightness level and it has to be
14 predetermined based on the difference in
15 quantity of the light based on the actual and
16 ideal response, so that's the way you calculate
17 the next overdrive level.

18 Q. I apologize, I interrupted.

19 A. AUO simply says a logic such as
20 circuitry for determining an output brightness
21 level, that's true as far as it goes, but the
22 patent describes how you get that and that's not
23 the full definition of determinator. So once
24 again, legal language, I don't know if you have

1 to include the whole description in the claim
2 term, but you certainly have to look at the
3 whole description when you apply it.

4 Q. Well, with respect to the '160
5 patent, what does it require with respect to a
6 determinator?

7 A. Well, I can explain, the patent
8 requires logic to determine the output
9 brightness level, and you predetermine it based
10 on the difference as we've talked about before
11 in the quantity of light between the actual and
12 ideal, simply.

13 So it's the actual which is the
14 square as we saw in previous measurements versus
15 -- I mean, the actual is the waveform and the
16 ideal is the square amount, so you predetermine
17 by measuring the difference then you can
18 calculate an overdrive level that would cause
19 the actual to be closer to the ideal.

20 Q. Do you have an understanding of
21 how LG Display performs its overdrive function?

22 A. Yes. After reading the TCON

Maximum responses --

A. I didn't hear the whole question.

Q. Do you know whether or not LG Display's customers define the necessary response time for a display?

A. Well, it's -- whether the customers require it or specify it, if it's a consumer in the store, no, he doesn't specify it. If you're selling it OEM equipment, then yes, they would specify it.

Q. Someone like Dell or HP?

A. Absolutely. But there is an art to that. It depends on the response of the liquid crystal and how much overdrive you're using. But as I mentioned there is a whole bunch of different measurements so they kind of summarize that into a number, which is a general number.

Q. Well, you mentioned earlier about the overdriving and the color change with

1 respect to the feed forward. And I believe
2 Dr. Silzars mentioned something about a final
3 visual check during his testimony yesterday.
4 Did you hear that?

5 A. Yes, I did.

6 Q. And I believe he said that to
7 imply the LG Display was somehow adjusting the
8 brightness level. Do you have an opinion as to
9 whether or not that is correct?

10 A. I have no idea of the intent of
11 why he said that, but I did hear it. As I think
12 I mentioned before, every display before you
13 make a judgment on it, you look at it. That's
14 obviously part of the prior art, and existing
15 art and future art. You look at the display for
16 a number of reasons. You look to see that the
17 gamma curve is right. You look to see that
18 there is no noise, or you look to see that you
19 haven't created artifacts due to things like
20 overdrive or MPEG encoding or decoding. You
21 look for all those things. You look to see if
22 the colors have changed because of your
23 overdrive.

24 And quite often there will be

1 excessive overdrive and you got to tone it down
2 in order to eliminate some of these artifacts.
3 There is a whole bunch of reasons why you would
4 look, but isn't it obvious that you would look
5 at a display before deciding it's ready for
6 sale.

7 Q. Could some of those artifacts be,
8 for example, a color shift?

9 A. That's what I mentioned. If you
10 got some different colors and you're getting
11 more overdrive on one than another, you're going
12 to have to turn down the overdrive. That could
13 be done while you look at it, say there is a
14 problem, go turn it down until the color is
15 right.

16 Q. Now, you mentioned that LG Display
17 calculates the response time. Did you look at
18 any documents from LG Display that helped you to
19

A. That's right, which would affect the light on the output. And Dr. Silzars mentioned there was some ripple which I imagine was the inverter, but there was also level changes that were going on, that would make it very difficult to make measurements. I can see it would be difficult. But that's not what the eyes see when they look at the display.

Q. Now, with respect to Dr. Silzars' test results, did you have any opinions?

1 A. Well, yes. First of all, as I
2 think you brought out before is that six out of
3 the 13 TCONs were not even measured with
4 overdrive disabled, so we have no way of
5 comparing the numbers.

6 But as I mentioned before, because
7 of the wrong instrument measuring, the
8 photometric data was not measured so the numbers
9 I don't believe are correct. The ideal quantity
10 in some cases were calculated, were calculated
11 incorrectly. And in almost all cases the time
12 integration quantity was calculated incorrectly.

13 There was overdrive on frame two
14 which was incorrect in the gray to gray
15 transitions. Backlight was disabled and I
16 didn't see any experimental errors so I have no
17 idea what the errors add up to, so I don't know
18 if I can compare two numbers, what the
19 tolerances are on those numbers.

20 So based on that, I really
21 conclude that the data is inaccurate. If I
22 received a report like this in a company, I
23 would reject it, of course. And you couldn't
24 draw conclusions from it. It's not valid data.

1 It needs to be -- it should be redone with the
2 corrections in order to get any kind of valid
3 data.

4 MR. GOODWYN: Your Honor, I'm
5 getting ready to move on to another topic. Is
6 it a good time for a break?

7 THE COURT: We'll take a
8 fifteen-minute recess.

9 (A brief recess was taken.)

10 THE COURT: All right. Be seated,
11 please.

12 BY MR. GOODWYN:

13 Q. Mr. Eccles, before the break we
14 were discussing your noninfringement opinions
15 with respect to LG Display's accused products.
16 In addition, did you form any opinions with
17 regard to invalidity of the '160 patent?

18 A. Yes, I did.

19 Q. What is your opinion?

20 A. Well, I analyzed several patents
21 that were prior art and I determined that in my
22 opinion the '160 patent, at least the claims,
23 the 1 and 3 that are addressed here are invalid.

24 Q. Did you look at one of the

1 references that was specifically identified in
2 the '160 patent, the Mori reference?

3 A. The Mori is -- actually the title
4 here is wrong. Next page, it's the '532 patent.

5 Do you want to go through each
6 one?

7 Q. Yes.

8 Can you show where each of the
9 limitations in Claim 1 are disclosed in the Mori
10 preference?

11 A. First of all, a liquid crystal
12 display comprising is shown in Mori and here in
13 the reference here, it says a liquid crystal
14 panel drive device.

15 Q. That's referencing a paragraph in
16 Mori?

17 A. Yes, paragraph one.

18 Q. What about the next limitation?

19 A. So an input logic is referenced in
20 paragraph ten in Mori, and shown in the figure
21 on Figure 1.

22 Q. And a storage for storing?

23 A. And the storage is also mentioned
24 in paragraph ten and shown on the Figure 11 --

1 well, the block 11 on Figure 1.

2 Q. Where it says capable of storing
3 one frame of image data, what does that mean?

4 A. That means it's a frame buffer or
5 it stores one entire frame of video drive memory
6 for all three colors.

7 Q. And what about a determinator?

8 A. So the determinator in this case
9 it mentions the ROM, the blocks, the ROM, the
10 comparator and the add or subtracter which look
11 like 12, 13 and 14 in Figure 1 of Mori.

12 Q. Now, you mentioned that it was
13 difficult to understand whether or not how the
14 determinator worked; is that right, or did I
15 misunderstand -- let me withdraw. I think I'm
16 misthinking of another question. Excuse me,
17 Mr. Eccles. It shows you're paying attention.

18 So as to make a time integration
19 quantity of a brightness change?

20 A. Well, Mori addresses that in a
21 sense and he talks about the optimal
22 increase/decrease values that have been stored
23 in advance. So it is addressed here. If you go
24 to the next --

1 Q. You mentioned that time
2 integration quantity of a brightness change
3 substantially equal to an ideal quantity of
4 light as being indefinite; is that right?

5 A. That's right.

6 Q. Is that shown in Mori?

7 A. Well, it's addressed in Mori, and
8 it calls the optimal increase, so what is the
9 optimal increase. And here he's talking about
10 rise time which results in an output, so you
11 know, to tell the truth if I'm analyzing this
12 patent, I would say that's indefinite, it is
13 it's optimal. What is optimal? I can't put a
14 number on it. Clearly the intent was to improve
15 on the previous arts and these kind of words
16 would be very well used in an SID symposium when
17 you're presenting papers and I have seen many
18 papers in IEEE as well.

19 As far as patent language, I'll
20 leave that to lawyers to define the term. I
21 don't know what optimal means. It means as good
22 as you can get to me.

23 Q. As good as you can get, would that
24 be substantially equal to the ideal quantity of

1 light?

2 A. I guess if we're just -- not
3 having well defined those terms, yes, it's the
4 same thing in my mind.

5 Q. What about the driver for driving
6 an image?

7 A. The driver, of course, is the
8 output that drives the liquid crystal selling
9 extension. It says end of segment driver
10 circuit, six, that drives the liquid crystal
11 panel, 208, perform the display based on the
12 output of this adder-subtractor 14. So its's
13 described there in Figure 1.

14 Q. Does Mori also disclose the
15 limitations of Claim 3?

16 A. Yes. First, you have to go look
17 at frame two. I mean, Claim 2, because Claim 3
18 is dependent on Claim 2, which, of course, is
19 dependent on Claim 1.

20 So we can see the reference to
21 Figure 3 in the Mori patent, which describes the
22 look-up table.

23 Q. That's the look-up table of Claim
24 2?

1 A. That's correct.

2 Q. And what about Claim 3?

3 A. Well, in Claim 3p --

4 Q. Let me go back so you can see it.

5 There you go.

6 A. There. Basically all it says is a
7 plurality of colors in a table. And so this, I
8 believe, is also part of the table. This is
9 part of the table.

10 If you go to the next one.

11 Although it seemed obvious in Mori, that he is
12 dealing with color, because he's driving
13 displays, it doesn't mention it precisely. So I
14 selected other patents that mention -- Kido
15 does.

16 For instance, an Okumura, who is a
17 very famous inventor of some of the overdrive
18 technologies, there's certain patents that are
19 mentioned on blue colors specifically.

20 Q. So let's look then at the Kido
21 reference you just mentioned.

22 A. Okay.

23 Q. Is it your opinion that the Kido
24 '860 reference invalidates the claims of the

1 '160 patent, the asserted claims?

2 A. Yes, it teaches all the
3 limitations certainly of Claims 1 and 3. For
4 instance, it provides for a liquid crystal
5 display. So an afterimage elimination circuit
6 for a liquid crystal display apparatus as
7 mentioned here.

8 Kido mentioned -- I'm not sure
9 what paragraph that is of the patent.

10 Q. How about an input logic?

11 A. Number 1 in the figure -- of
12 Figure 4 as denoted in the text is the input
13 logic.

14 Q. That's --

15 A. Text is Column 6, Lines 34 to --
16 37 to 40. Excuse me.

17 Q. And a storage for storing?

18 A. Storage is mentioned in Column 6,
19 Lines 37 to 40 and also Figure 4.

20 Q. And that's identified in the
21 figure as memory?

22 A. Number three, memory.

23 Q. How about determinator?

24 A. Determinator is mentioned in the

1 text Column 7, Line 6 through 16. And it's
2 shown in Figure 4, as you can see here.

3 Q. And those are elements four?

4 A. Subtractor of the coefficient
5 circuit matter to do the determination.

6 Q. And what about making a time
7 integration quantity of a brightness change
8 substantially equal to an ideal quantity of
9 light in a stationary state?

10 A. This is interesting, because Kido
11 shows an outward form that's a square wave. It
12 appears to be the ideal response. And, of
13 course, the goal of overdrive is to achieve the
14 ideal response, which is a voltage, which is
15 output response from the liquid crystal. The
16 brightness outputs being a square-wave-type
17 response.

18 So the prior art, the current art,
19 future art, the goal is to mimic that actual
20 response time. And there are -- some liquid
21 crystals over time got faster and faster. They
22 start at maybe a hundred milliseconds, were up
23 around 30 at the time '160 wasn't.

24 Now, we hear numbers eight, four

1 even 2.5 are advertised for televisions.
2 There's a ^ fair oh, electric liquid crystal
3 that I've used in head mounted displays which is
4 much faster than that. So essentially with a
5 tiny bit of overdrive, it achieves the ideal
6 quantity of light just because you've improved
7 the response.

8 So, here, I think any technique
9 that is trying to mimic the ideal response is
10 eventually going to get to the ideal quantity of
11 light, because the ideal response leads to the
12 ideal quantity of light.

13 So my -- in my opinion, that this
14 also teaches that same limitation of the '160.

15 Q. Okay. And then we see further
16 described in Column 5, Lines 41 to 44 the
17 compensation.

18 Why is it important to know what
19 the compensation is for signals going in the
20 opposite direction?

21 A. Well, as in the context of the
22 '160, it talks about the rise and fall, and you
23 measure the time integration quantity under the
24 falling curve.

1 So, obviously, this -- all signals
2 have a fall eventually. So what goes up must
3 come down.

4 So, in this case, he's talking
5 about the falling time as well.

6 Q. So if you were able to achieve as
7 close as possible to the ideal response time,
8 would you achieve as close as possible to the
9 ideal quantity of light?

10 A. That would be a natural by-product
11 and that's the goal of what overdrive display
12 designers are doing.

13 Q. How about the driver?

14 A. Well, the driver is mentioned that
15 in Column 7, Lines 4 to 24 and in Figure 4.

16 Q. And is it item Number 8?

17 A. Yes, it is.

18 Q. Well, in addition to Kido showing
19 all the elements or all the limitations of Claim
20 1, did you also compare it to claims -- to
21 asserted Claim 3?

22 A. Yes, I did. To 2 -- and -- well,
23 I had to look at Claim 2 as well.

24 Q. Right.

1 A. And in Figure 4 of Kido, it
2 mentions in Column 9, Lines 27 through 32. It
3 mentions about the --

4 Q. The read-only memory?

5 A. The ROM is the read-only memory
6 which --

7 Q. What about the number of plurality
8 of input columns?

9 A. Well, obviously in Figure 9, we've
10 got red, green and blue, and it mentions in the
11 text Column 6, Lines 51 through 54.

12 Q. Now, there's another reference,
13 Johnson. Did you review or form an opinion with
14 respect to whether the Johnson '254 patent
15 discloses all of the elements shown in the
16 asserted claims of the '160 patent?

17 A. Yes, I did.

18 Q. Okay. Can you step us through
19 that, please?

20 A. Okay. Johnson, the liquid crystal
21 device is described in -- liquid crystal device
22 based on plane switching in which the switching
23 speed is, and so forth. So, obviously it's
24 talking about liquid crystal.

1 Also mentions the --

2 Q. I'm sorry.

3 A. Also mentions it hydrodynamical
4 test of the liquid crystal. It shows they're
5 driving some response time.

6 Then the input logic is mentioned
7 in Column 3, Lines 15 and 16 and also shown in
8 Figure 7.

9 Q. Storage for storing?

10 A. Storage, you can see. Obviously,
11 here's the drum figure. It looks like Figure
12 32. I mean, Item 32. And Figure 7, it's
13 mentioned.

14 In the patent, Column 4, 67
15 through 5, Line 2. And field store is mentioned
16 in Column 4, Lines 66 and 67.

17 Q. How do you know a field delay is a
18 storage?

19 A. Well, it's obvious from the
20 circuit designer, that's what you're doing.
21 It's, also -- as I mentioned, there's a drum up
22 here, which is the common symbol for a memory,
23 digital memory device.

24 And that's how -- in reading the

1 patent, that's the operation of it, obviously.
2 In fact, we've seen this picture before. It's
3 got the input coming, video.

4 It's got frame store or a delay.
5 It could be called a frame delay or a storage.
6 And then they both go to look-up tables to
7 create new values.

8 Q. What about the limitation relating
9 to a determinator?

10 A. The determinator is described in
11 Table 1, and it mentions it in Column 4, Line 65
12 through Column 5, Line 14. And you can see in
13 the table that there's replacement values.

14 Q. Are those replacement values or
15 are those output values?

16 A. Well, okay. You're right. These
17 are output values that are -- in terms of
18 voltages, normally the digital memory has
19 digital values or bits.

20 And so it's described here for, I
21 guess, purposes of illustration that they're
22 voltages. They correspond to voltages that are
23 going to drive the liquid crystal.

24 Q. What about the next element, so as

1 to make a time integration quantity of a
2 brightness change substantially equal to an
3 ideal quantity of light?

4 A. Well, Johnson addresses this. You
5 can see in Figure 5.

6 And he discusses it in Column 6,
7 Line 61 through 65. Talks about a rise time.

8 And as you can see, as you improve
9 the rise time, it gets closer to the ideal
10 quantity of light. So, certainly, we talked
11 about the claim limitation that requires that it
12 be closer to the ideal quantity than if no
13 preventive measures were taken.

14 So this, obviously, does that.
15 And because it's an overdrive, it will, of
16 course, overdrive. In this case, he's got
17 really slow response time liquid crystal, but
18 it's -- through the years, as the response time
19 improves, then the rise time will go actually
20 above.

21 And he basically teaches once you
22 go above, slow it down and get equal, that's
23 because he was talking about such slow response
24 times. But as you get to a faster response

1 time, you can overdrive during the frame and
2 then come down.

3 So I believe it's obvious, in some
4 instances, applying the Johnson overdrive scheme
5 to liquid crystals that have a faster response
6 time than what he's showing here, you will get
7 some instances where it does achieve the ideal
8 quantity of light or even higher.

9 He also refers to the falling time
10 which is in Column 4, Lines 29 through 32.

11 Q. Okay. So that the rise time and
12 the fall time would allow you to determine the
13 quantity of light?

14 A. That's right. He teaches that.

15 Q. And what about the last limitation
16 driver?

17 A. Well, then the data that goes out
18 to the drive is taught in Column 5, Lines 10
19 through 12, as well as it's shown in Figure 7.

20 Q. Okay. Did you also look at Claim
21 3?

22 A. Yes, I did. By first looking at
23 Claim 2, and so there's a -- Claim 2 mentions a
24 table for storing, and obviously, I already

1 mentioned Table 1 is representative of storing.
2 And it mentions in Column 4, Lines 46 through 54
3 of the table.

4 And it also mentions while taking
5 into, for example, the hydrodynamical properties
6 of liquid crystal material into account.

7 Q. What does that mean?

8 A. Well, that's adjusting for the
9 slow response time of the liquid crystal. And
10 it's obvious that it's also different for
11 different cells, and materials, and colors and
12 things. But any way, he's making a general
13 statement here, I believe.

14 Q. Okay. What about Claim 3 for
15 Johnson?

16 A. Well, I think it's obvious, he was
17 driving color displays. That -- I didn't see it
18 mentioned specifically.

19 MR. SHULMAN: That says Kido.
20 That doesn't say Johnson.

21 MR. GOODWYN: I understand.

22 THE WITNESS: That's correct. As I
23 was saying, I didn't find specific mention to
24 color in Johnson, although it's obvious that he

1 was driving. So I think to be technically
2 correct, I'd refer to a different patent to
3 teach that portion of it.

4 And so Claim 2 -- obviously, I
5 mentioned Kido mentions the -- mentions the
6 table for storing, mentions the colors, the red,
7 green and blue. And it mentions it in Column 6,
8 Lines 51 through 54.

9 Q. Is there another reference that
10 you considered that shows the same limitations
11 of three colors?

12 A. Yes. In the Okumura patent '257,
13 it also obviously identifies in Figure 4 the
14 red, green and blue, and identifies it in text,
15 pixel signal by -- talks about the data basis of
16 conversion characteristics, which may vary with
17 the data delayed by the field memory.

18 Well, actually -- well, it shows
19 it in Figure 4.

20 Q. But the text then refers to the
21 compensating circuit shown in Figure 4?

22 A. That's right. For converting the
23 transmittance data, which understood from Figure
24 4 that it's different colors.

1 Q. So in summary, Mr. Eccles, what is
2 your opinion regarding infringement of LGD's --
3 LG Display's accused products with respect to
4 Claim 1 and 3 of the '160 patent?

5 A. Well, I think I have explained my
6 analysis of the claim. That is, LG does not
7 infringe upon the Claims 1, 2 or 3.

8 Q. What about validity?

9 A. Well, actually in reading the
10 prior art, I believe that the '160 certainly in
11 Claims 1, 2 and 3 should not be valid.

12 Q. Now, in forming your opinions and
13 that you've discussed, I want to show you a list
14 of materials that were included in the binder
15 and that we have gone over today.

16 The patent, and the prosecution
17 history, and the joint claim construction
18 statement, and a number of exhibits to your
19 report, as well as to Dr. Silzars' report. Did
20 you rely on all of these documents in forming
21 your opinions today?

22 A. I relied on those and some others.
23 Yes.

24 MR. GOODWYN: Okay. Your Honor, I

1 would like to offer into evidence LG Display
2 Trial Exhibit Number 1083 and all the documents
3 cited therein.

4 MR. SHULMAN: No objection, Your
5 Honor.

6 THE COURT: Admitted.

7 MR. GOODWYN: Thank you.

8 MR. SHULMAN: Your Honor, before I
9 begin the cross, can I just deal with one
10 housekeeping matter?

11 THE COURT: Sure.

12 MR. SHULMAN: During my
13 cross-examination of Dr. Rubloff, I referred to
14 LGD 629-015, which was a slide that they used
15 during the direct. And there's no way to know
16 what that is in the record.

17 So I'd like to mark for
18 identification as AUO Exhibit 1585. I'm not
19 offering it into evidence, but just marking it
20 for identification, so we know that it's that
21 slide.

22 THE COURT: We can -- actually I
23 think a good technique is to actually admit it
24 into the record, unless you object and just give

1 it the designation of the number plus A.

2 MR. SHULMAN: I have no problem
3 with admitting it into the record, but I didn't
4 follow the last part of what you just said.

5 THE COURT: Is that the same
6 number that was used in the reference during the
7 course of the presentation?

8 MR. SHULMAN: Correct. And I've
9 just marked it with an exhibit number, because
10 it didn't have an exhibit number.

11 THE COURT: Oh, so you gave it a
12 separate exhibit number?

13 MR. SHULMAN: Correct. That's
14 what I'm doing right now.

15 THE COURT: Okay. That's fine.

16 MR. SHULMAN: Slide LG 629-015 is
17 AUO Exhibit 1585.

18 Slide LGD 629-019 is exhibit AUO
19 Exhibit 1586.

20 Slide LGD 629-023 is AUO Exhibit
21 1587.

22 And then there were excerpts from
23 LGD Exhibit 380 that were part of the direct
24 examination of Dr. Rubloff. There were two

1 excerpts.

2 The first pertained to the product
3 known as LT060V1. And we've marked that as AUO
4 Exhibit 1589.

5 And lastly, the second excerpt
6 from LGD Exhibit 380, which pertained to the
7 product LT071D1, we have marked as AUO 1590.

8 THE COURT: It's admitted.

9 MR. SHULMAN: Thank you.

10 MR. GOODWYN: Your Honor, if I
11 could just do one housekeeping thing as well,
12 perhaps it will clarify or simplify things. I'd
13 like to offer into evidence the demonstratives
14 that were used with Dr. Rubloff as LG Display
15 Trial Exhibit 1084 and the demonstratives used
16 with Mr. Eccles as LG Display Trial Exhibit
17 1058, so there's a complete set of all the
18 demonstratives instead of just pieces.

19 THE COURT: It will be admitted.

20 MR. SHULMAN: That's fine. Your
21 Honor, how much time do we have today, so I can
22 gauge myself?

23 THE COURT: We're going until five
24 o'clock.

1 MR. SHULMAN: Okay.

2 CROSS-EXAMINATION

3 BY MR. SHULMAN:

4 Q. Mr. Eccles, we've not met before;
5 correct?

6 A. No. Hello.

7 Q. Hello. As you probably know, my
8 name is Ron Shulman, and I have a few questions
9 for you.

10 Now, in your opinion, what the
11 overdrive invention of the '160 patent seeks to
12 do is to cause the pixels and the liquid crystal
13 display to emit a quantity of light that is
14 equivalent to the ideal quantity of light;
15 correct?

16 A. Basically, yes, under the
17 conditions that are described in the '160.

18 Q. Now, let's focus on conventional
19 overdrive systems that predate the invention of
20 the '160. In your opinion, seeking to improve
21 the response time of the liquid crystal material
22 is the fundamental purpose of conventional
23 overdrive; correct?

24 A. Well, seeking to improve the

1 response time, yes, in order to get better
2 motion pictures on the display. So the end goal
3 is to make a better picture, but yes, what they
4 do is improve the response time.

5 Q. Okay. And the Mori prior art
6 reference that you spoke about today is an
7 example of a conventional overdrive system;
8 correct?

9 A. Yes.

10 Q. And the Kido prior art patent that
11 you relied upon is another example of such an
12 overdrive system that attempts to improve
13 response time; right?

14 A. It has some nuances in it that I
15 wouldn't say are conventional, has some
16 additions, but basically that's the same thing
17 it tries to do, yes.

18 Q. And the Johnson prior art patent
19 that you relied upon today is, yet another
20 example of such an overdrive system that
21 attempts to improve the response time; correct?

22 A. That's true.

23 Q. Okay. Now, is it true, sir, that
24 if you use the prior art overdrive system such

1 as Mori, and Kido and Johnson that seek to
2 improve the response time, you may emit, but you
3 will not necessarily emit a quantity of light
4 that approaches the ideal?

5 A. That's true, you may also emit the
6 actual quantity of light or you may emit more.
7 You're right, it would be -- it could occur,
8 it's not a guarantee to occur.

9 Q. In fact, merely improving response
10 time can result in an amount of light that is
11 farther away from the ideal amount of light than
12 would be the case if the response time were not
13 improved; correct?

14 A. That's possible in the case where
15 you're improving the rise time and the fall time
16 is faster than the rise time, so there is
17 particular waveforms and liquid crystal
18 materials that if you drove it that way, you
19 could get less time integration quantity of
20 brightness than if you didn't do it.

21 Q. Indeed there is an example of that
22 in the patent?

23 A. That's right.

24 Q. That's Figure 5B; right?

1 A. I believe so.

2 Q. Right.

3 Now, is it true, sir, that
4 although the Kido reference discusses improving
5 response time, it nowhere mentions improving the
6 quantity of light?

7 A. That's correct.

8 Q. And is it likewise true, sir, that
9 the other prior art references that you rely
10 upon today nowhere mentions improving the
11 quantity of light?

12 A. They do not mention that per se.
13 As I mentioned, they attempt to match the ideal
14 response time which would be an indirect way of
15 achieving the ideal quantity of light, but
16 you're right, they do not specifically mention
17 the issue of quantity of light.

18 Q. It may or may not be an indirect
19 way of improving the quantity of light as we
20 just went over?

21 A. It may or may not.

22 Q. Let's turn to the '160 patent and
23 let's again by looking at unasserted Claim 12 on
24 the screen, please.

1 This is not asserted. But do you
2 see that Claim 12 is a method for driving a
3 liquid crystal? I'm not going to ask you
4 detailed questions about this.

5 A. Yes.

6 Q. And according to unasserted Claim
7 12, that method comprises a series of steps that
8 are recited there; right?

9 A. Right.

10 Q. Now, let's look at asserted Claim
11 1 on the screen. Do you see that in contrast,
12 to method Claim 12, Claim 1 covers a liquid
13 crystal display itself?

14 A. Yes.

15 Q. Okay. And according to Claim 1,
16 the liquid crystal display itself comprises
17 certain structures that are set forth in the
18 claim; right?

19 A. Yes.

20 Q. And Claims 2 and 3 depend from
21 Claim 1; right?

22 A. That's right.

23 Q. And each of Claims 2 and 3 call
24 for additional structures that are not recited

1 in Claim 1 by itself; right?

2 A. Yes.

3 Q. Okay. Now, unlike method Claim 12
4 which calls for certain steps to be performed,
5 asserted Claims 1 through 3 call for structures
6 that make up the liquid crystal display;
7 correct?

8 A. I'm not familiar with the term
9 structure, but it sounds right.

10 Q. Structures are things you can look
11 at and touch and feel?

12 A. If we're talking laymen's terms,
13 yes.

14 Q. Yeah, I don't mean to confuse you
15 with legales.

16 A. Okay.

17 Q. And do you understand, sir, that
18 to infringe Claim 1 or Claim 3, someone has to
19 either make, use or sell a liquid crystal
20 display that contains these various structures
21 that are defined in the claim?

22 A. Yes.

23 Q. Okay. And Claims 1 and 3 do not
24 recite any steps that must be performed before

1 making, using or selling the liquid crystal
2 display; correct?

3 A. Well, when it talks about a
4 determinator, it puts some definition to that in
5 that it's based on the previous brightness level
6 and next brightness level and comparing it, so I
7 think the process of doing that is inherent in
8 the definition of the determinator.

9 Q. We're going to get to that. You
10 would agree that whatever -- we'll get to the
11 definition of determinator. This recites
12 structure, Claim 1, not method steps; right?

13 A. I'm afraid I'm not familiar enough
14 with the terms structure and method to comment
15 on that.

16 Q. You would agree that the word
17 "step" does not appear in Claim 1; right?

18 A. The word "step"?

19 Q. Yes.

20 A. I don't see it in Claim 1.

21 Q. And it doesn't appear in Claim 2
22 or 3 either; right?

23 A. I'll take your word for it that it
24 doesn't.

1 Q. Well, if you have any doubt, you
2 better confirm it for yourself.

3 A. I better.

4 Q. If you're willing to accept my
5 representation, just say so.

6 A. No, I do not see the word step.

7 Q. But in your opinion, Claim 1
8 requires what you call a predetermination step;
9 correct?

10 A. That's correct.

11 Q. Okay. And you'd agree with me,
12 however, that the word predetermined or
13 predetermination or any of its variants also
14 does not appear in Claim 1, Claim 2 or Claim 3;
15 right?

16 A. Right, I used that word.

17 Q. Right.

18 Now, in contrast to asserted
19 Claims 1 through 3, which don't mention
20 predetermining anything, there are other
21 nonasserted claims in this patent that
22 specifically require a predetermination step;
23 correct? For example, let's look at nonasserted
24 method Claim 9 on the screen.

1 A. Okay.

2 Q. And do you see there the very
3 first subparagraph of that claim specifically
4 recites a step that calls for storing certain
5 predetermined information; right?

6 A. Well, this is referring to a
7 predetermined gray scale level which is the
8 input, and all inputs are predetermined.

9 Q. Okay. But it's calling for
10 something that's storing something that's
11 predetermined, that's the step; right?

12 A. It says the word predetermined,
13 and I would say it's referring to the input.

14 Q. Okay. So based on what we see in
15 nonasserted Claim 9, would you agree that the
16 inventors of this patent knew how to include a
17 predetermination step when they intended to do
18 so?

19 A. Well, I have no idea of their
20 intent or their ability in English language or
21 if somebody helped them, I couldn't comment on
22 that. I agree that they didn't put the word in
23 Claim 1.

24 Q. But you want to include it in

1 Claim 1?

2 A. I don't have to include that word,
3 but we're talking about -- if we're talking
4 about the determinator, you're comparing the two
5 different levels, then that work needs to be
6 done in order to calculate the overdrive for the
7 lookup table.

8 Q. It's your opinion that Claim 1
9 requires what you have called quote a
10 predetermination step; right?

11 A. That's my opinion, yes.

12 Q. Okay. Now, you have expressed the
13 opinion that LG's accused products don't
14 infringe Claims 1 through 3 of the patent, or
15 Claims 1 and 3, rather?

16 A. Yes.

17 Q. Because LG does not practice the
18 predetermination step that you believe is
19 required; right?

20 A. That's one of the reasons, yes.

21 Q. Let's call that opinion number
22 one, just focusing on predetermination. And let
23 me ask up a hypothetical. If the Court were to
24 conclude that the predetermination step is not

1 required by Claim 1, then opinion number one of
2 yours should be rejected; correct?

3 A. Well, Claim 1, LG still would not
4 violate Claim 1.

5 Q. For other reasons, I'm just
6 talking about predetermination. If the Court
7 rejects your notion that predetermination is an
8 element of Claim 1, then opinion number one
9 which hinges on the absence of predetermination
10 would have to be rejected; correct?

11 A. Well, if -- I think you could
12 explain it in other terms. It clearly states
13 what needs to be done in Claim 1 in order to
14 come up with the overdrive values for the lookup
15 tables, so whether you call that
16 predetermination or not, there is something that
17 needs to be done to achieve that, because it
18 talks about achieving the ideal quantity of
19 light.

20 Q. But what you have referred to as
21 the predetermination step is what I'm using for
22 purposes of my question. And if the Court
23 rejects that what you've referred to as the
24 predetermination step is an element of Claim 1,

1 then your noninfringement opinion based upon the
2 necessity of practicing that predetermination
3 step would disappear; correct?

4 A. I don't think it's that simple.

5 Q. Okay. Let's move on, then.

6 Now, is it correct that in your
7 opinion, Claims 1 through 3 also require that
8 something called an offset must be applied to
9 the next brightness level?

10 A. Yes.

11 Q. And do you agree that the word
12 offset does not appear in Claims 1 or 3 or 2?

13 A. (Witness reviewing document.)
14 Claim 2 talks about modifying said brightness
15 level.

16 Q. Does the word offset appear, that
17 was the question?

18 A. The word offset does not appear.

19 Q. Okay. Now, in contrast to
20 asserted Claims 1 through 3, which do not
21 mention any offset, there are other nonasserted
22 claims in this patent that specifically require
23 the use of an offset; correct?

24 A. Yes.

1 Q. For example, let's look at
2 independent Claim 4, which is not being
3 asserted. And as you can see on the screen, in
4 the third and fourth subparagraphs of Claim 4,
5 they specifically call for an offset; right?

6 A. Yes.

7 Q. Okay. So would you agree that
8 based on what we see in Claim 4, whoever drafted
9 this patent knew how to include the use of an
10 offset when they intended to do so?

11 A. Certainly in Claim 4 they intended
12 to and they did.

13 Q. But the inventors or whoever
14 drafted this patent chose not to include an
15 offset in the asserted Claims 1 through 3;
16 right?

17 A. It does not appear there, yes.

18 Q. But you want to include one?

19 A. I think that's one way to state
20 it, yes.

21 Q. Okay. Now, let's say the judge
22 rejects your position that an offset is required
23 by Claims 1 through 3. You've expressed the
24 opinion that LG's accused products don't

1 infringe those claims because LG doesn't use an
2 offset; right?

3 A. That's one reason, yes.

4 Q. And so if the judge rejects your
5 view that offset is required by Claims 1 through
6 3, then he would likewise have to reject your
7 opinion that there is no infringement because of
8 the absence of an offset?

9 A. In the strict sense of looking at
10 the offset and the word offset, what you said is
11 true. But you do have to read the claim and
12 understand what is described here, so I'm not
13 sure that the word is that important. If you
14 take that word out, but as long as you apply the
15 claim, then that would be an interpretation that
16 would apply for the Judge to look at.

17 Q. Let's talk about your third and
18 final basis for concluding that LG does not
19 infringe the asserted claims. And again, let's
20 look at Claim 1. And the second element of
21 Claim 1 calls for a storage structure in which
22 the previous brightness level is stored. Do you
23 see that?

24 A. Yes.

1 Q. In your opinion LG's accused
2 products don't have that element; right?

3 A. That's correct.

4 Q. And in your opinion the storage
5 structure in the accused products stores a
6 compressed representation of the previous
7 brightness level rather than the data itself;
8 right?

9 A. Yes.

10 Q. Okay. And in your opinion, the
11 compressed representation of the brightness
12 level data is different than the brightness
13 level data itself; right?

14 A. Yes, that's obvious from looking
15 at the data tables.

16 Q. For that reason you conclude that
17 the accused products lack the storage element of
18 Claim 1 and, therefore, do not infringe; right?

19 A. Yes. As you read the text in the
20 claim, it clearly says the previous brightness
21 levels, so I conclude that.

22 Q. In forming your opinions
23 concerning how the accused products work, you
24 relied on various documents and deposition

1 transcripts among other things; right?

2 A. Yes, I did.

3 Q. And one of the deposition
4 transcripts you relied upon was the testimony by
5 an LG engineer, Mr. Jong Kim; right?

6 A. Yes, I did.

7 Q. Do you recall that Mr. Kim was
8 designated by LG to testify about the
9 implementations of overdrive in accused LG
10 products?

A. First, yes, I testified to that.
And I would like to explain the meaning if I
may.

Q. Well, I tell you what, you can do
that on redirect.

MR. GOODWYN: Your Honor, again,
counsel is continuing to interrupt the witness's
answers. He tried repeatedly to say that he
wanted to explain his answer and I believe to
give a full response the witness should be
entitled to provide a full response to question.

THE COURT: You can give an
explanation.

THE WITNESS: Could I have the
question back please.

Q. I asked you did you testify that
in the accused products that LG sells, the small
differences that may be introduced are
acceptable and allowable, you said yes, and now
you want to give an explanation?

A. Yes. The differences that occur
first of all, the restructured or the

1 decompressed data is used to calculate overdrive
2 values, and so what it's going to do is it is
3 going to cause some errors in the overdrive as
4 it's calculated. There could be some small
5 errors that you would have to look closely at,
6 there could be some larger errors that would be
7 glaring. When you look at a display as you
8 mentioned, I have had quite a bit of experience
9 at evaluating TV performance, if you're selling
10 a TV that's going to sell for \$200 you would
11 gladly accept a lot of those artifacts because
12 the price is so low. If you're selling
13 something for more than a thousand dollars or
14 two-and-a-half thousand dollars, you would need
15 to examine much more closely and eliminate those
16 artifacts.

17 So are they acceptable? It
18 depends on the product and depends on how well
19 you can do with the technology and how much you
20 want to save money by reducing the memory size.

21 Q. Okay.

22 A. So that's what I mean by
23 acceptable.

24 Q. Very good.

1 Would you agree, sir, that if the
2 compressed and decompressed data in the accused
3 LG products were substantially different than
4 the original data, LG wouldn't be able to sell
5 its modules?

6 A. I'm not sure what you mean by
7 substantially different. You're talking about
8 the data that goes into the lookup table, not
9 the output?

10 Q. If the compressed and then
11 decompressed data is substantially different in
12 the accused LG products from the original data
13 that exists before it's compressed, if those
14 things were substantially different, then
15 wouldn't you agree that LG wouldn't be able to
16 sell any of its modules?

17 A. Well, first of all, there is two
18 parts to that question. What does substantially
19 different mean? Different data is -- if it's
20 supposed to be 24 and it's 36, is that
21 substantially different? That's 30 percent. If
22 it's supposed to be a hundred and it's 110,
23 that's ten percent. I'm not sure what
24 substantially different is.

1 But once again we have to remember
2 this data is only used to calculate the
3 overdrive values. This data is not displayed on
4 the screen. So as I explained in the block
5 diagram, it goes up there, it calculates
6 overdrive values and because it's put in blocks
7 there is an average that occurs over the
8 display. So although the numbers can be quite
9 different, maybe even substantially different,
10 there will -- there could be some averaging of
11 that over the display, so I'm not prepared --
12 first of all, since I don't know exactly what
13 substantially different means in terms of
14 numbers, I couldn't really define it, but
15 certainly differences will occur and I could
16 look at a display and tell you where that's
17 occurring, and I could go to a store and tell
18 you that because those products are sold.

19 Q. Okay. Whatever the differences
20 are between the original data and the
21 decompressed data on the other end, it's good
22 enough for LG to sell the products?

23 A. Obviously, yes.

24 Q. Now, you believe that Kido

1 anticipates the '160; right?

2 A. Yes.

3 Q. And do you recall being asked at
4 your deposition whether Kido teaches
5 compensation such that the time integration
6 quantity of a brightness change is effectively
7 equal to the ideal quantity of light, do you
8 recall being asked that question?

9 A. I don't recall the question. I
10 recall the topic and about that, I don't recall
11 exactly that question.

12 Q. Let's look at your deposition at
13 102, lines 16 to 19.

14 "QUESTION: It's your opinion that
15 Kido teaches compensation such that the time
16 integration quantity of a brightness change is
17 effectively equal to the ideal quantity of
18 light?"

19 So you were asked that question;
20 right?

21 A. Yes.

22 Q. Let's look at the answer. Your
23 response was, "No, I don't believe that's what I
24 said."

1 And then you continue to explain
2 what you meant; right?

3 A. Yes.

4 Q. Now, let's look at page one of
5 Exhibit L to your expert report on validity.
6 And this is a claim chart. Can you blow up the
7 top there, Bill. Thanks.

8 This a claim chart you prepared
9 comparing the '160 claims to the Kido reference;
10 right?

11 A. Yes.

12 Q. And if we could focus in on the
13 bottom two boxes on that page, you identified
14 something called the after image elimination
15 circuit shown in Figure 4 of Kido as
16 corresponding to the determinator; right?

17 A. Yes.

18 Q. And as you state here this after
19 image elimination circuit outputs a quote,
20 compensated video signal, unquote; correct?

21 A. Yes, it does.

22 Q. So if Kido's after image circuit
23 corresponds to the claim determinator, then am I
24 correct in understanding that Kido's output

1 compensated video signal corresponds to the
2 claimed output brightness level in your opinion?

3 A. Well, yes, it determines an output
4 brightness level, it may -- yes, in those
5 particular words, yes.

6 Q. And let's explore that. Kido's
7 compensated video signal is the sum of two other
8 signals; correct?

9 A. Yes.

10 Q. And it's the sum of something
11 called Si, and the compensation signal Ss;
12 correct, right down there at the bottom?

13 A. I can't see that.

14 Q. Figure 2 B at the bottom of the
15 page.

16 A. I can't see it.

17 Q. It's very small.

18 Bill, go back to page two of
19 Exhibit L down at the bottom there, blow up
20 Figure 2B. There is Si, and --

21 A. Ss, yes, the compensation is added
22 to the Si.

23 Q. Okay. And Figure 3 of Kido refers
24 to the compensation signal Ss; correct?

1 And let me point you to where the
2 Kido patent says that, column seven, lines 45 to
3 60 of Kido. See it refers to the compensation
4 signal illustrated in Figure 3?

5 A. Yes.

6 Q. And the compensation signal Ss of
7 Figure 3 is a voltage; correct?

8 A. It appears to be so because it has
9 a fault to it.

10 Q. And according to your view of the
11 world, a voltage is not a brightness level;
12 correct?

13 A. No, that's not true.

14 Q. Let's look at your deposition.
15 Page 108, lines 13 to 15.

16 "QUESTION: Is it not a brightness
17 level then?

18 "ANSWER: A voltage is not a
19 brightness level. So it refers to a voltage."

20 You did give that testimony;
21 correct?

22 A. I need to read before and after
23 this and I could explain fully.

24 Q. Well, you can do that on redirect.

1 Now, asserted Claim 3 of the '160
2 depends from Claims 1 and 2; correct?

3 A. I'm sorry, I didn't understand.

4 Q. Claim 3 depends from Claims 1 and
5 2; right?

6 A. Yes.

7 Q. And Claim 3 includes all of the
8 limitations of Claims 1 and 2; right?

9 A. Yes.

10 Q. Now, let's look at Claim 2 and how
11 you compared it to Kido. Okay?

12 A. Okay.

13 Q. Your comparison can be found at
14 page four of Exhibit L to your expert report on
15 validity which is now on the screen. Do you see
16 page -- Claim 2 down there being compared to
17 Kido on the screen, sir. It's from your expert
18 report.

19 A. Okay.

20 Q. And Claim 2 requires that the
21 determinator include a table for storing a
22 brightness level; correct?

23 A. Yes.

24 Q. Now, let's look at the third box

1 on the right of page four of Exhibit L on the
2 screen and there you state that the Kido
3 reference discloses the claimed table in the
4 form of a table of values held in a ROM that is
5 described at column 9, lines 27 through 32 of
6 Kido; right?

7 A. I'm sorry, I didn't follow that.
8 Are you reading from the slide?

9 Q. Yes.

10 It says that the claimed table in
11 Kido, it's disclosed in the form of a table of
12 values held in a ROM and that's disclosed at
13 column 9, lines -- it's the highlighted text,
14 sir.

15 The table in Claim 2, what you
16 found corresponding in Kido is a table of values
17 held in a ROM which is described at column 9,
18 lines 27 through 32?

19 A. Okay. The table is the ROM?

20 Q. Right. Are you with me?

21 A. Yes.

22 Q. Now, as indicated in this same box
23 we're looking at on the screen, the ROM
24 described at column 9, lines 27 through 32 of

1 Kido is an implementation of what Kido calls
2 coefficient circuits. Do you see that?

3 A. Yes.

4 Q. Okay. And the implementation of
5 the coefficient circuits discussed in column 9
6 of Kido stores values K1 and K2 in the ROM
7 table; correct?

8 I can show you your deposition if
9 you don't recall.

10 A. That sounds right. I believe so.

11 Q. But K1 and K2 are not brightness
12 levels; correct?

13 A. I need to look at the --

14 Q. Let's look at your deposition,
15 110, lines 17 through 20.

16 "QUESTION: Now, K1 and K2 are not
17 brightness levels; correct?

18 "ANSWER: No. They are
19 coefficients, they're abstract concepts or
20 mathematical concepts."

21 That was your testimony; right?

22 A. In the context we were talking
23 about that, yes, that's what I did reply.

24 Q. Let's turn to Johnson. And let's

1 look at Johnson Figure 5, which is now on the
2 screen. And you agree that the goal of
3 Johnson's invention is to have the pixel reach
4 the desired brightness before the next frame
5 time; correct?

6 A. Well, he states that as a goal.
7 Yes, but other things occur.

8 Q. Okay. Right.

9 But that's one of the goals?

10 A. That's one of the goals, yes.

11 Q. And that goal is what's
12 illustrated by the dotted line with the
13 parenthetical three that's in the middle of
14 Johnson Figure 5; right?

15 A. If you're referring to that's the
16 goal that he wanted to get to, yes.

17 Q. Okay.

18 A. In this case, 60 percent
19 transmission.

20 Q. You would agree that what we see
21 here in curve number two in Johnson, the curvy
22 curve up at the top there, certainly would not
23 be the ideal quantity of light during the first
24 frame time namely between time zero and time T

1 sub F?

2 A. In this particular case with these
3 examples of these very slow rise times, that's
4 true. There's no way for that to get to the
5 ideal quantity of light.

6 Q. Okay.

7 A. However, with -- as the years go
8 by and technology improves, then -- and as the
9 rise time gets less, than the frame time,
10 certainly that would occur using this technique.

11 Q. Now, during the first frame time,
12 namely between time zero and time $T_{sub F}$,
13 what's shown in curve number two in Johnson
14 Figure 5 appears to be -- appears to be closer
15 to the ideal quantity of light than curve number
16 one where no overdrive is used; right?

17 A. Yes, it is.

18 Q. However, you would agree that
19 merely providing something that is closer to the
20 ideal quantity of light does not meet your
21 definition of the claim phrase substantially
22 equal; right?

23 A. Absolutely. It does not meet my
24 definition, nor do I see how it could meet

1 anybody's definition of substantially equal.

2 Q. Okay. In your opinion, to be
3 substantially equal to the ideal quantity of
4 light, two conditions have to be met.

5 First, the actual quantity of
6 light has to be such that it can be accepted as
7 substantially equivalent to the ideal quantity.

8 And, second, the actual quantity
9 of light should represent an improvement over
10 what you would get without using overdrive at
11 all; correct?

12 A. I can clearly understand the
13 second part being closer. The first part is so
14 nebulous. I believe it's indefinite.

15 If there was a definition of what
16 that was; absolutely, yes. It would need to
17 meet that.

18 I -- I just have trouble defining
19 that, and so I have offered some numbers in
20 different cases that I think would be acceptable
21 or hardly visible. But in the actual definition
22 of that, I leave that to somebody else to decide
23 what it is going to be interpreted as legally.

24 Q. Well, let's see what you said at

1 your deposition. See if -- let's just see what
2 you said at your deposition.

3 Page 51, Lines 5 through 16.

4 "Question: Is it your view then
5 that you really need to meet both conditions?
6 One, the quantity has to be such that it can be
7 accepted as substantially equivalent; and, two,
8 it should represent an improvement over what you
9 would get without using overdrive?"

10 "That's correct." And then you
11 proceeded to explain.

12 A. Just like I did now.

13 MR. GOODWYN: Objection, Your
14 Honor. I'd like to have the record reflect the
15 full question and the full answer.

16 MR. SHULMAN: I'll read it.

17 MR. GOODWYN: And the full answer.
18 We have been getting partial answers in the
19 record.

20 MR. SHULMAN: I'll read it in.
21 Your answer was, "That's correct. I still have
22 difficulty with the first statement of defining
23 what is accepted as substantially equivalent,
24 but that's the intent. You need to be accepted

1 as substantially equivalent, and it needs to be
2 some improvement over a circuit that has no
3 overdrive applied."

4 BY MR. SHULMAN:

5 Q. Both conditions; right?

6 A. That's correct.

7 Q. Okay. Now, you didn't mention the
8 Hartman reference today, did you?

9 A. No, I did not.

10 Q. It was in your expert report, but
11 we heard nothing about it today; right?

12 A. I didn't mention it today. No.

13 Q. And in your expert report, you
14 mentioned a -- I don't know how to pronounce it
15 U-E-N-O reference.

16 A. Ueno.

17 Q. Ueno?

18 A. Ueno.

19 Q. Ueno. Thank you.

20 A. It's Japanese.

21 Q. You didn't mention that one today
22 either; right?

23 A. I didn't feel that I needed to. I
24 think there was plenty of evidence and

1 descriptions in the patents that I did use.

2 Q. Right. Just give me a moment. I
3 have a couple of other questions.

4 Do you have the set of slides?
5 Can we have the elmo please?

6 MR. SHULMAN: Can I confer with
7 counsel for a moment?

8 THE COURT: Sure.

9 (Following a discussion held off
10 the record:)

11 BY MR. SHULMAN:

12 Q. 1085 is the LG Exhibit Number for
13 the slides that were used during his direct
14 examination, and I'm going to refer you to Slide
15 44 in that deck. Okay.

16 A. Okay.

17 Q. Do you recall this slide?

18 A. What slide number is that?

19 Q. Hang on. Hang on. This is Slide
20 44.

21 If you need me to zoom in, just
22 let me know or you can look in your book.

23 A. I can look at it here. I can't
24 quite see it on the display.

1 Q. Slide 40. Woah.

2 A. Okay.

3 Q. Okay?

4 A. Yes. I don't see it up there, but
5 I see it here in mine.

6 Q. This was a comparison of Mori to
7 Claim 1; right?

8 A. Yes.

9 Q. Okay. Either my eyes are bad or
10 the focusing isn't working.

11 A. The focus is not good there, but I
12 can see it on the page that I have.

13 Q. Can you tell me what the question
14 mark, the green question mark means?

15 A. Yes. I believe that that
16 particular limitation is indefinite.

17 Q. So you're not sure if Cori -- Mori
18 rather has ideal in it?

19 A. I'm sure of the word optimal as I
20 am sure of the word ideal. So if you're fair to
21 both sides, then yes, I believe it teaches that.

22 Q. Okay.

23 A. Now, I asked the reporter during
24 your direct testimony to jot down an answer that

1 you gave. In fact, it was the last answer on
2 direct.

3 And he can't both read it and
4 write at the same time, but she's now taking it
5 down, so maybe we get around that problem;
6 right?

7 THE REPORTER: Right.

8 BY MR. SHULMAN:

9 Q. But at the tail end of your
10 examination --can I borrow that for a moment?
11 And I'll have the reporter read it in, because
12 you don't have to take my word for it.

13 But at the tail end of the direct
14 examination, you were giving sort of a
15 conclusory summary of what your opinions were
16 with respect to the patent. Do you recall that?

17 A. Yes.

18 Q. And you spoke about infringement.
19 You spoke about validity; right?

20 A. Yes.

21 Q. And with respect to infringement,
22 you summarized the opinions that you had -- that
23 you expressed today rather concerning the tests
24 that our expert wrote; right?

1 A. Yes.

2 Q. And those tests were described in
3 the report that he submitted, I think it was in
4 February sometime; right?

5 A. I don't recall the date. I
6 remember the report.

7 Q. The first round of reports?

8 A. That would have been February
9 20th.

10 Q. 7th?

11 A. Or 4th maybe.

12 Q. So -- and so you had the
13 opportunity to review that report from February
14 27th until certainly up through the time of your
15 deposition was taken; right?

16 A. Yes, I did.

17 Q. And your deposition was taken in
18 April? April or May?

19 A. It was late April.

20 MS. HOLLOWAY: April 21st.

21 MR. SHULMAN: April 21st, I'm
22 told.

23 THE WITNESS: Yes.

24 BY MR. SHULMAN:

1 Q. And at the tail end of your cross,
2 or I'm sorry, your direct, you said, and I'll
3 have the court reporter read it, "But if I
4 received a report like this in a company, I
5 would reject it, of course. And you couldn't
6 draw a conclusion from it. It's not valid
7 data."

8 You were referring to Dr. Silzars'
9 report; correct?

10 A. Yes, I was.

11 Q. Okay. And the opinions that you
12 expressed today concerning Dr. Silzars' -- the
13 inadequacies of Dr. Silzars' report were not set
14 forth in your expert report; correct?

15 A. In my -- no, I had no chance to --
16 the opinions that I ascribed today, I don't
17 believe were set forth in my expert report. No.

18 Q. Right. And you had a month to
19 prepare your expert report after receiving
20 Dr. Silzars' report; right?

21 A. Yes, I did.

22 Q. And then at your deposition?

23 A. Well, I didn't have exactly a
24 month. I got documents from McKenna, Long &

1 Aldridge. It wasn't exactly at the same time.
2 It took some time.

3 But approximately, you know, maybe
4 three weeks I had.

5 Q. Well, your responsive report was
6 submitted a month after --

7 A. Right.

8 Q. -- his report was submitted?

9 A. That's right.

10 Q. Correct?

11 And then you had another month
12 before your deposition was taken; right?

13 A. Yes.

14 Q. And at your deposition -- is the
15 elmo still on? Yes.

16 Pardon my ineptitude. This is
17 Page 73.

18 You were asked: "Okay." This is
19 all about Silzars' report and his experiments.

20 "Okay. But sitting here today,
21 you have no basis for saying that they are not
22 accurate, is that fair?"

23 "I have no -- I've not noticed any
24 evidence or something concrete that I would say

1 is incorrect in his measurements. I -- as I
2 explained, I don't have enough information to
3 determine if they are correct or not."

4 And you had his report for two
5 months at that point; correct?

6 A. Approximately, yes.

7 MR. SHULMAN: I have no further
8 questions.

9 THE COURT: All right. How long
10 do you have?

11 MR. GOODWYN: I actually just have
12 a couple of questions. I have one request that
13 one of the first deposition transcripts they put
14 up and only read a portion of an answer. I
15 request that the record reflect an entire answer
16 and then I have one quick question.

17 THE COURT: All right. Ask it.

18 MR. GOODWYN: Then we'll get that
19 conclusion under Rule 106.

20 REDIRECT EXAMINATION

21 BY MR. GOODWYN:

22 Q. Mr. Eccles, you were just asked as
23 to whether or not you had included any analysis
24 of or opinions regarding Dr. Silzars' testing in

1 your report; is that right?

2 A. Yes, I was.

3 Q. Okay. And you -- I believe that
4 the deposition transcript that counsel put on
5 the screen during your cross was that you said
6 you didn't have enough information; isn't that
7 right?

8 A. That was part of my answer. Yes.

9 Q. When did you first get sufficient
10 explanation of Dr. Silzars' testing methodology
11 to allow you to understand what he did?

12 A. Approximately last week when I
13 received his deposition transcript, and I
14 noticed that he mentioned using silicon detector
15 photo diode that was linear response, and that
16 he compared it to several others that were also
17 in linear response and that he did not do
18 calibration.

19 At that point I got to thinking,
20 What's the validity of these measurements? So
21 with my experience with making radiometric
22 versus photometric measurements, it was obvious
23 to me that the actual data would not be what the
24 eye sees, which is what the '160 calls out.

1 Therefore, at that point I
2 realized that the measurements of all this data
3 was incorrect. As I further studied and looked
4 at the report, I admit I missed something and
5 that was the time integration quantity of light
6 and the ideal quantity of light.

7 I just -- I probably arrived at
8 that last week after I got into the
9 measurements. I was thinking about, Well, how
10 would the curve be different if I applied a
11 photometric curve?

12 And I go, Woah, that's not even
13 the right thing to measure. So, at that point,
14 I started -- that's when I made the list of what
15 things I would have done when I was directing
16 photometric measurements.

17 And I realized the set up, the
18 calibration, all those things, elements were
19 missing. So, yes, I should have noticed it a
20 couple of months ago, but the trigger was the
21 deposition testimony, that incorrect sensor was
22 used.

23 MR. GOODWYN: Thank you. No more
24 questions.

1 THE COURT: All right. Thank you.

2 You may step down. Thank you.

3 All right. We'll be in recess
4 until 9:30 tomorrow morning.

5 THE CLERK: All rise.

6 MR. BONO: Your Honor, can we just
7 handle that right now for the ten seconds,
8 because I just -- we need them as a professional
9 courtesy to put that segment on. We don't know
10 what page it's from.

11 He didn't cite the page number.
12 If he could just put that on the screen, we'll
13 read it in and then be done with that one
14 housekeeping issue.

15 THE COURT: Sure.

16 MR. BONO: If you could do that,
17 please.

18 MR. SHULMAN: It was professional
19 courtesy. I did read the pages and line
20 numbers, but I'm happy to do it again.

21 MR. BONO: Thank you.

22 MR. SHULMAN: Do you know what the
23 point was?

24 MR. BONO: It's where the answer

1 was no.

2 MR. SHULMAN: What was it?

3 MR. BONO: It was like the third
4 read in right before --

5 MR. SHULMAN: The very first one?

6 MR. GOODWYN: Yes.

7 MR. SHULMAN: Whoops. I'm looking
8 at the wrong outline. Pardon me.

9 We're not going to be able to do
10 it now. We'll work it out and we'll do it first
11 thing in the morning.

12 THE WITNESS: I could find it.

13 MR. SHULMAN: Pardon?

14 THE WITNESS: I could find it.

15 THE COURT: You can do it in the
16 morning. We will make that the first order of
17 business. You will have a chance.

18 MR. BONO: Just one other thing,
19 Your Honor. It's my understanding, AUO is
20 proposing to call a rebuttal witness, Mr. Sung,
21 and we filed a motion this morning to preclude
22 this testimony.

23 And I wanted to alert Your Honor
24 to this. We believe the testimony should not be

1 permitted.

2 THE COURT: I didn't see the
3 motion. I didn't know it was filed. I'll take
4 a look at it.

5 MR. SHULMAN: We're going to be
6 submitting a responsive brief today.

7 THE COURT: All right. So I'll
8 get them both and get you an answer tomorrow.

9 All right. We will be in recess
10 until 9:30 tomorrow morning.

11 MR. SHULMAN: Thank you, Your
12 Honor.

5 CERTIFICATE OF REPORTER
6

7 I, Heather M. Triozzi, Registered
8 Professional Reporter, Certified Shorthand Reporter,
9 and Notary Public, do hereby certify that the
10 foregoing record, Pages 667 to 1,047 inclusive, is a
11 true and accurate transcript of my stenographic notes
12 taken on June 4, 2009, in the above-captioned matter.
13

14 IN WITNESS WHEREOF, I have hereunto set my
15 hand and seal this 4th day of June, 2009, at
16 Wilmington.
17
